Partial Differential Equations Thomas Hillen, I. E. Leonard, Henry van Roessel, 2014-08-21 Uniquely provides fully solved problems for linear partial differential equations and boundary value problems Partial Differential Equations Theory and Completely Solved Problems utilizes real world physical models alongside essential theoretical concepts With extensive examples the book guides readers through the use of Partial Differential Equations PDEs for successfully solving and modeling phenomena in engineering biology and the applied sciences The book focuses exclusively on linear PDEs and how they can be solved using the separation of variables technique The authors begin by describing functions and their partial derivatives while also defining the concepts of elliptic parabolic and hyperbolic PDEs Following an introduction to basic theory subsequent chapters explore key topics including Classification of second order linear PDEs Derivation of heat wave and Laplace's equations Fourier series Separation of variables Sturm Liouville theory Fourier transforms Each chapter concludes with summaries that outline key concepts Readers are provided the opportunity

to test their comprehension of the presented material through numerous problems ranked by their level of complexity and a related website features supplemental data and resources Extensively class tested to ensure an accessible presentation

Partial Differential Equations is an excellent book for engineering mathematics and applied science courses on the topic at the upper undergraduate and graduate levels

Partial Differential Equations and Boundary-Value Problems with Applications Mark A. Pinsky, 2011 Building on the basic techniques of separation of variables and Fourier series the book presents the solution of boundary value problems for basic partial differential equations the heat equation wave equation and Laplace equation considered in various standard coordinate systems rectangular cylindrical and spherical Each of the equations is derived in the three dimensional context the solutions are organized according to the geometry of the coordinate system which makes the mathematics especially transparent Bessel and Legendre functions are studied and used whenever appropriate throughout the text The notions of steady state solution of closely related stationary solutions are developed for the heat equation applications to the study of heat flow in the earth are presented The problem of the vibrating string is studied in detail both in the Fourier transform setting and from the viewpoint of the explicit representation d Alembert formula Additional chapters include the numerical analysis of solutions and the method of Green s functions for solutions of partial differential equations The exposition also includes asymptotic methods Laplace transform and stationary phase With more than 200 working examples and 700 exercises more than 450 with answers the book is suitable for an undergraduate course in partial differential equations
