Science Experiments 2025 Tutorial:

Statistical Design and Analysis of Biological Experiments Hans-Michael Kaltenbach, 2026-02-16 This richly illustrated book provides an overview of the design and analysis of experiments with a focus on non clinical experiments in the life sciences including animal research It covers the most common aspects of experimental design such as handling multiple treatment factors and improving precision In addition it addresses experiments with large numbers of treatment factors and response surface methods for optimizing experimental conditions or biotechnological yields The book emphasizes the estimation of effect sizes and the principled use of statistical arguments in the broader scientific context It gradually transitions from classical analysis of variance to modern linear mixed models and provides detailed information on power analysis and sample size determination including portable power formulas for making quick approximate calculations In turn detailed discussions of several real life examples illustrate the complexities and aberrations that can arise in practice Chiefly intended for students teachers and researchers in the fields of experimental biology and biomedicine the book is largely self contained and starts with the necessary background on basic statistical concepts The underlying ideas and necessary mathematics are gradually introduced in increasingly complex variants of a single example Hasse diagrams serve as a powerful method for visualizing and comparing experimental designs and deriving appropriate models for their analysis Manual calculations are provided for early examples allowing the reader to follow the analyses in detail More complex calculations rely on the statistical software R but are easily transferable to other software This second edition includes a separate chapter on the interplay between design and analysis which discusses the construction and interpretation of Hasse diagrams the definition of linear models that match a design and the specification of these models in statistical software In addition a new chapter covers the use of additional concomitant measurements to improve precision as well as baseline measurements which are frequently encountered in biological experiments Though there are few prerequisites for effectively using the book previous exposure to basic statistical ideas and the software R would be advisable

Architecture and AI

Mustapha El Moussaoui, 2026-03-05 This book addresses the growing need for architects and designers to critically engage with artificial intelligence in visual and spatial production It offers a systematic approach to understanding directing and constraining generative models Combining theoretical insights with technical instructions the book explains how contemporary AI tools such as latent diffusion models can be employed effectively and responsibly Rather than relying on AI as an automatic image generator the book proposes a methodology grounded in control feedback and authorship It introduces practical workflows using platforms like ComfyUI MidJourney Grasshopper and others to explore constraints prompt structure and how procedural logic can be harnessed to produce intentional coherent results Intended for architects educators researchers and students this volume positions AI not as a substitute for design expertise but as a configurable system that must be shaped by the disciplinary and ethical priorities of architecture
