Ladle, 2009 Although biodiversity is a relatively new coinage scientists have been studying the subject it describes long before the word's first appearance in the language in the mid 1980s In 1973 for instance the UK Systematics Association held a symposium on The Changing Flora and Fauna of Britain which concluded that not enough attention was being paid to the conservation of rarities a conclusion also reached said the symposium at a meeting of the Linnaean Society some forty years earlier By 1980 the Global 2000 Report to the President published by the US Council on Environmental Quality starkly warned of a diminution of up to one fifth of all species by the turn of the century and there is now a growing consensus that the world faces a biodiversity crisis a potentially catastrophic global loss of genetic ecosystem and most obviously species diversity Indeed especially since the UN Convention on Biological Diversity was promulgated in Rio de Janeiro in 1992 conserving biodiversity has become the principal focus of the global conservation movement Indeed the study of the origins maintenance and protection of diversity has become perhaps the most vibrant offshoot of ecology and conservation studies It is increasingly taught and studied in universities and other research institutions around the world Addressing the need for an authoritative reference work to make sense of this rapidly growing subject and its ever more complex and multidisciplinary corpus of scholarly literature Biodiversity and Conservation is a new title in the Routledge series Critical Concepts in the Environment Edited by Richard Ladle of Oxford University's Centre for the Environment this new Major Work brings together in five volumes the foundational and the very best cutting edge scholarship to provide a synoptic view of all the key

issues and current debates *Encyclopedia of Biodiversity* Simon A. Levin,2001 Includes articles on agriculture ecology forests wetlands and environment as well as organisms **Ecological Effects of Roads** I F Spellerberg,2002-01-07 This book is a review of the ecological effects of roads These effects include pollution impacts on plant and animal habitats and disturbance to ecological systems Many animals are killed by traffic More importantly new roads fragment natural habitats By far the greatest effects are the cumulative effects over time This is a textbook for students and a manual for the practitioner It provides a detailed account of the methods used to address the ecological effects of roads Controversial in parts e g it is argued that some roads should be decommissioned this book will prompt much discussion and will prompt action to prevent the damaging effects of roads on nature BOOK JACKET Title Summary field provided by Blackwell North America Inc All Rights Reserved **Heterogeneity in Forest Structure Prior to Restoration by Fire** Kurt Martin Menning,2003 During a century of fire suppression forest may have become more homogeneous In many western forests fire is being reintroduced yet the effects are not well understood The best method of reintroducing fire to forested ecosystems has been debated To assess the effects of disturbance on structure we must quantify heterogeneity in the forest before and after disturbance I explored means to assess heterogeneity and measured it in the mixed conifer forest and in the litter base that vectors fire I present a new statistical metric for describing the distribution of forest structure The metric can be used to assess forest structural heterogeneity at different spatial scales Ground and surface fuels are essential for vectoring a contagious disturbance like fire Fire models often assume uniform fuel characteristics for a forest community I explored how litter bulk density could vary by dominant tree species I modeled how variability in litter bulk density could affect fire behavior and found differences in fireline intensity and rate of spread among different dominant tree species Adapted from abstract The British National Bibliography Arthur James Wells,2000 **Models for Planning Wildlife Conservation in Large Landscapes** Joshua Millspaugh, Frank R. Thompson,2009 Intended to provide a recipe for successful development of wildlife habitat models and their implementation in conservation planning the book could be used in studying wildlife habitat models conservation planning and management techniques Additionally it may be a supplemental text in courses dealing with quantitative assessment of wildlife populations Additionally the length of the book would be ideal for graduate student seminar course Using wildlife habitat models in conservation planning is of considerable interest to wildlife biologists With ever tightening budgets for wildlife research and planning activities there is a growing need to use computer methods Use of simulation models represents the single best alternative However it is imperative that these techniques be described in a single source Moreover biologists should be made aware of alternative modeling techniques *Subject Guide to Books in Print* ,2001 *Aspects of Biodiversity in Selected Forest Ecosystems in Italy* C.R.A.-Istituto Sperimentale per la Selvicoltura Arezzo,2006 Systematic and Applied Entomology I.
