**Abstract:** Rough set theory is considered as the most essential strategy significantly suitable for abstracting distinctive sets of learning styles controlled by the learners during e-learning process through flimsy information abstraction. The Rough set hypothesis is likewise utilized for effectively finding relations with conflicting or fragmented information which is incomplete in nature. Be that as it may, when harsh set hypothesis is considered, they are not sufficiently effective to evaluate ideal subsets. Hence, this paper provides a comparison of various rough set based techniques for abstracting learning styles. The paper provides the analysis of rough set based clustering method in terms of two parameters selection and coupling. In addition, the paper also proposes an enhanced methodology based on normalized score value for finding the deviation between data's through the equivalence property of rough set theory. The experimental results show that the proposed algorithm outperform the stated method.

**Keywords:** Roughset theory, e-learning, Learning styles, Normalization, Standard deviation.

### 1 Introduction

E-learning is one of the emerging technologies incorporated by the worldwide educational organization for the purpose of enabling services like (i) providing virtual learning facilities, (ii) creating content for various domains for learners, (iii) creating the virtual class environment by means of online admission, online attendance and online conduction of classes[1]. In order to give successful online administrative services in an e-learning system, the information about the learners and their interested domains of learning must be known. This type of learners' information assumes a vital role for the effective usage of e-learning framework [2]. However, the problem associated with this implementation methodology is growth of learners' information exponentially towards the time factor [3]. Then, the analysis of learning factors in a large amount of learners' information becomes a challenging issue. Hence, there is a need arises to incorporate a set of adaptable rules to analyze the learners' information for designing an effective and efficient e-learning system.

This paper contributes a rough set theory based data analysis model for mining relevant and significant information from the large amount of learners' data of the e-learning system. This model incorporates the principle of reducts in rough set theory for extracting knowledge from the learners' information [4].

The learning style of an individual is one of the imperative data to be derived from the learners' information. Since, the nature of the
