Bharucha,2016 Structural failure of a rack due to vibration could result in injury to people damage to IT equipment or interruption of services that depend on proper functioning of the IT and networking equipment in the rack In this topic a computational study of an IT rack and a group of racks placed adjacent to each other under three vibration load scenarios transportation office and earthquake vibration is presented Each rack can weigh as much as 1600 kg 3500 lb when fully populated with IT equipment Two standards commonly used for testing racks with synthetic seismic loads are the GR 63 CORE Network Equipment Building Systems NEBSTM and the International Building Code IBC In this paper the earthquake office and transportation vibration loads as given in GR 63 CORE are applied on a computer aided design

CAD model of the rack mentioned above The material used is ASTM A36 A572 series steel The IT equipment was made in CATIA V5 Solidworks and then imported into ANSYS Workbench where it was meshed After meshing a pre stressed Modal Analysis was run to find the natural frequencies of the body From the output result of Modal analysis all modes of vibration were included as input for Response Spectrum analysis RS analysis as those modes will be the dominant modes for vibration Harmonic Response is used to analyze office vibrations as the swept sine wave Harmonic Response resembles office environment vibrations Random vibration analysis is used for transportation vibration All the acceleration curves and standard for testing are in correlation with GR 63 CORE NEBSTM standard Other boundary conditions included is that the M8 screw used to bolt the bottom of the IT equipment
