Channel Sensing in Cognitive Radio by Using MATLAB. N. Krishna Chaitanya, Bimal Bhattarai, Ashok Subedi, 2018 The development in wireless communication along with various applications has put so many limitations on the use of radio spectrum When we look at spectrum utilization most of the times the radio spectrum is not used properly Some of the frequency bands in the spectrum are unoccupied some frequency bands are less occupied and a few bands are heavily occupied Cognitive radio is the novel concept which can successfully deal with the growing demand and scarcity of wireless spectrum by effectively utilizing the unoccupied frequency bands Cognitive radio is an intelligent wireless architecture which searches the spectrum holes and allows unlicensed users to access licensed spectrum bands Spectrum sensing is used to detect the spectrum holes providing high spectrum resolution capability We have generated an experimental model of cognitive radio system using MATLAB In this paper we delve into the idea of simulating cognitive radio system for effective utilization of vacant frequency bands The performance of cognitive radio has been tested using MATLAB R2012a

Performance Analysis of Cognitive Radio Networks for Resource Sharing Kamal Chapagain, Nanda Bikram Adhikari, 2014-10-07 In cognitive radio system secondary users are queued when primary users are utilizing its own channel In that case secondary transmitters are idle and waiting for that channel to be freed If so why not use that idle secondary transmitter for primary users as helping hands by transmitting primary s data This book explore the scarcity and management of current spectrum issue and proper management in three distinct methodologies Firstly Field surveying of spectrum within the range of 0.1 GHz to 3 GHz is done for finding white space Secondly white space is managed using user friendly graphical environment programmed in Matlab Finally performance is increased by reducing waiting delay in queue for secondary users Sharing 50% of primary users data by secondary transmitter performance is increased up to 41% based on traffic load of incoming data on server and better on high traffic Wireless Regional Area Network IEEE 802.22 parameters with data rate 24 Mbps is used for simulation in Matlab

proposed analytical study was evaluated by intensive simulations using MATLAB. The presence of Additive White Gaussian Noise is assumed. Many important aspects of spectrum sensing in cognitive radio networks are included such as receiver operating characteristics, detection rate versus signal to noise ratio (SNR) and the minimum required sample points for a specific performance. All simulations were performed to include most factors affecting the efficiency of the proposed sensing methodology such as number of tapers K , number of sample points N and the probability of false alarm P_f . A comparison with energy detection method was done. All simulation results and comparisons confirm that the proposed model is reliable and robust under all factors considered in the simulation.

Cognitive Radio Omar Hamad Altrad, 2013

Efficient utilization of the spectrum has become a fundamental requirement in modern wireless networks due mainly to spectrum scarcity and the ever increasing demand for higher data rate applications and internet services. A particularly interesting proposal to meet this requirement is the cognitive radio (CR) system which can adapt its transmission parameters according to the environment. CRs as will be shown in later chapters are very efficient in maximizing spectrum utilization due to their inherent spectrum sensing capability. The purpose of this dissertation is to investigate and analyze two main components of CR. First is the sensing or exploring component which is the core of a CR device as it is the first stage to discover spectrum holes (SHs) in a spectrum band. For this component a new algorithm to compute the detection probability in the case of odd degrees of freedom and a closed form expression for the detection probability in Nakagami m fading channels are presented both for a local spectrum sensing scenario. For a cooperative scenario the errors of CRs decisions which are caused by erroneous feedback channels are analyzed. In addition the optimal number of CRs that are required to mitigate against such errors is derived. The second component is the access or exploiting component i.e. how a CR device can exploit SHs efficiently. To study the second component the interactions between the primary users (PUs) and secondary users (SUs) are modeled as a continuous time Markov chain (CTMC). Based on the CTMC model the effect of two inevitable sensing errors, misdetection and false alarm on the blocked call probability, the dropped call probability and system utilization is investigated for two access schemes. In the first scheme the PUs are considered to access the system using a standard access policy. In the second scheme the PUs use non standard access policies. In both schemes the overall primary and secondary system utilization is analyzed and compared under both perfect and imperfect sensing. The simulation results obtained concur with the analytical ones and it is determined that spectrum utilization can be improved by choosing a suitable non standard access policy.
