Simatic Profinet Io Siemens:

Automating with PROFINET Raimond Pigan, Mark Metter, 2015-10-29 PROFINET is the first integrated Industrial Ethernet Standard for automation and utilizes the advantages of Ethernet and TCP/IP for open communication from the corporate management level to the process itself. PROFINET CBA divides distributed complex applications into autonomous units of manageable size. Existing fieldbuses such as PROFIBUS and AS Interface can be integrated using so-called proxies. This permits separate and cross-vendor development, testing, and commissioning of individual plant sections prior to the integration of the solution as a whole. PROFINET IO with its particularly fast real-time communication fulfills all demands currently placed on the transmission of process data and enables easy integration of existing fieldbus systems. Isochronous real-time IRT is used for isochronous communication in motion control applications. PROFINET depends on established IT standards for network management and teleservice. Particularly to automation control engineering, it offers a special security concept. Special industrial network technology consisting of active network components, cables, and connection systems together with recommendations for installation complete the concept. This book serves as an introduction to PROFINET technology. Configuring engineers, commissioning engineers, and technicians are given an overview of the concept and the fundamentals they need to solve PROFINET-based automation tasks. Technical relationships and practical applications are described using SIMATIC products as an example. *Networked Systems In Industry 4.0: Bus Systems . Industrial Ethernet . Mobile Communication . Cyber Physical Systems* Reinhard Langmann, 2025-02-25 The networking of devices, machines, and systems plays a key role in Industry 4.0. This textbook conveys the basic knowledge required for the successful use of intelligent networked production systems. It is aimed at students from the fields of mechanical engineering, electrical engineering, as well as process and environmental engineering, and is also suitable for practitioners who are involved in the automation of production. The book is divided into three parts. Part I is dedicated to the basics of networking and bus systems, including their procedures, methods, and structures of local networks, hardware, and software components of embedded systems, the properties of selected fieldbus systems, and open communication between networked systems based on Open Platform Communications. Part II deals with the Industrial Ethernet, as well as wireless and mobile communication systems. Part III deals with the networking of cyber-physical systems, which form the basis for Industry 4.0 scenarios. Its coverage includes the architectures and services for Industry 4.0 and Industrial Internet of Things, communication infrastructures, and protocols for Industry 4.0 production systems and networking in the digital factory. The basics of networked systems are illustrated using numerous application cases. More than 80 exercises provide the opportunity to test and deepen the knowledge acquired. The solutions to all the exercises, as well as additional supplementary material, are also available.
