Linear Functional Analysis for Scientists and Engineers Balmohan V. Limaye, 2016-06-18 This book provides a concise and meticulous introduction to functional analysis. Since the topic draws heavily on the interplay between the algebraic structure of a linear space and the distance structure of a metric space, functional analysis is increasingly gaining the attention of not only mathematicians but also scientists and engineers. The purpose of the text is to present the basic aspects of functional analysis to this varied audience, keeping in mind the considerations of applicability. A novelty of this book is the inclusion of a result by Zabrejko which states that every countably subadditive seminorm on a Banach space is continuous. Several major theorems in functional analysis are easy consequences of this result. The entire book can be used as a textbook for an introductory course in functional analysis without having to make any specific selection from the topics presented here. Basic notions in the setting of a metric space are defined in terms of sequences. These include total boundedness, compactness, continuity, and uniform continuity. Offering concise and to the point treatment of each topic in the framework of a normed space and of an inner product space, the book represents a valuable resource for advanced undergraduate students in mathematics and will also appeal to graduate students and faculty in the natural sciences and engineering. The book is accessible to anyone who is familiar with linear algebra and real analysis.

**Functional Analysis** Balmohan Vishnu Limaye, 1996 This book is an introductory text written with minimal prerequisites. The plan is to impose a distance structure on a linear space, exploit it fully, and then introduce additional features only when one cannot get any further without them. The book naturally falls into two parts, and each of them is developed independently of the other. The first part deals with normed spaces, their completeness, and continuous linear maps on them, including the theory of compact operators. The much shorter second part treats Hilbert spaces and leads up to the spectral theorem for compact self-adjoint operators. Four appendices point out areas of further development. Emphasis is on giving a number of examples to illustrate abstract concepts and on citing various applications of results proved in the text. In addition to proving existence and uniqueness of a solution, its approximate construction is indicated. Problems of varying degrees of difficulty are given at the end of each section. Their statements contain the answers as well.

*Functional Analysis* Markus Haase, 2014-09-17 This book introduces functional analysis at an elementary level without assuming any background in real analysis, for example on metric spaces or Lebesgue integration. It focuses on concepts and methods relevant in applied contexts such as variational methods on Hilbert spaces, Neumann series, eigenvalue expansions for compact self-adjoint operators, weak differentiation, and Sobolev spaces on intervals, and model applications to differential and integral equations. Beyond that, the final chapters on the uniform boundedness theorem, the open mapping theorem, and the Hahn-Banach theorem provide a stepping stone to more advanced texts. The exposition is clear and rigorous, featuring full and detailed proofs. Many examples illustrate the new notions and results. Each chapter concludes with a large collection of exercises, some

of which are referred to in the margin of the text tailor made in order to guide the student digesting the new material

Optional sections and chapters supplement the mandatory parts and allow for modular teaching spanning from basic to honors track level

**Linear Functional Analysis** Hans Wilhelm Alt, 2016-07-06 This book gives an introduction to Linear Functional Analysis which is a synthesis of algebra topology and analysis In addition to the basic theory it explains operator theory distributions Sobolev spaces and many other things The text is self contained and includes all proofs as well as many exercises most of them with solutions Moreover there are a number of appendices for example on Lebesgue integration theory A complete introduction to the subject Linear Functional Analysis will be particularly useful to readers who want to quickly get to the key statements and who are interested in applications to differential equations

**Linear Functional Analysis** Joan Cerda, 2010 Functional analysis studies the algebraic geometric and topological structures of spaces and operators that underlie many classical problems Individual functions satisfying specific equations are replaced by classes of functions and transforms that are determined by the particular problems at hand This book presents the basic facts of linear functional analysis as related to fundamental aspects of mathematical analysis and their applications The exposition avoids unnecessary terminology and generality and focuses on showing how the knowledge of these structures clarifies what is essential in analytic problems The material in the first part of the book can be used for an introductory course on functional analysis with an emphasis on the role of duality The second part introduces distributions and Sobolev spaces and their applications Convolution and the Fourier transform are shown to

be useful tools for the study of partial differential equations Fundamental solutions and Green s functions are considered and the theory is illustrated with several applications In the last chapters the Gelfand transform for Banach algebras is used to present the spectral theory of bounded and unbounded operators which is then used in an introduction to the basic axioms of quantum mechanics The presentation is intended to be accessible to readers whose backgrounds include basic linear algebra integration theory and general topology Almost 240 exercises will help the reader in better understanding the concepts employed A co publication of the AMS and Real Sociedad Matematica Espanola RSME Table of Contents Introduction Normed spaces and operators Frechet spaces and Banach theorems Duality Weak topologies Distributions Fourier transform and Sobolev spaces Banach algebras Unbounded operators in a Hilbert space Hints to exercises Bibliography Index GSM 116
