

Costal Engineering

Costal Engineering is a branch of civil engineering that deals with the design and construction of structures and systems that are exposed to the forces of the sea. This includes the design of harbours, piers, breakwaters, and coastal defences. It also involves the study of coastal erosion and the development of strategies to protect the coastline.

The main objective of costal engineering is to provide a safe and secure environment for the coastal population and to protect the natural resources of the coast. This is achieved by the design and construction of structures that are able to withstand the forces of the sea. The design of these structures is based on a detailed study of the coastal environment and the forces that act on it. This includes the study of the tides, waves, and currents, and the effects of these forces on the structures.

Costal engineering is a highly specialised field of civil engineering that requires a deep understanding of the coastal environment and the forces that act on it. It is a challenging and rewarding profession that offers a wide range of opportunities for professional growth and development.
