O-ring Installation for Underwater Components and Applications C. J. Sandwith, 1982 *Practical Seal Design*
Leonard J. Martini, 2018-05-04 This compact on the job handbook provides all the practical and theoretical information to design elastomeric O ring seals for the full range of static reciprocating and rotary functions Complete with fully illustrated detailed examples to guide you step by step through virtually every seal design situation Practical Seal Design provides thorough coverage of ring seal geometry material compound capability material performance and design methods detailed design considerations including stretch swell shrinkage and blowout prevention as well as innovations to extend seal life span and minimize system hysteresis unmatched treatment of piston cylinder seal and shaft seal design and clearly elucidated specifications for military aerospace and industrial standards With quick access features to facilitate prompt proper and effective design Practical Seal Design is an essential single source reference for mechanical manufacturing industrial automotive aeronautical and ocean engineers Furthermore this one of a kind work is an excellent reference text for professional seminars on hydrodynamic pneumatic and mechanical engineering systems and undergraduate mechanical design courses

Gland Design, O-ring and Other Elastomeric Seals A-6C2 Seals Committee, 2005 This SAE Aerospace Standard AS provides standardized gland groove design criteria and dimensions for elastomeric seal glands for static and dynamic applications The glands have been specifically designed for applications using SAE AS568 size O rings with related class 2 tolerances at pressures exceeding 1500 psi 10 342 kPa utilizing one or two anti extrusion backup rings and applications at pressures under 1500 psi 10 342 kPa without backup rings The glands have been sized to provide sufficient squeeze for effective sealing while at the same time limiting squeeze to allow satisfactory operation in dynamic applications While this specification covers the basic design criteria and recommendations for use with standard size O rings these glands are also suitable for use with other elastomeric and polytetrafluoroethylene PTFE based seals and packings

Evaluation of Elastomers as O-ring Seals for Liquid Rocket Fuel and Oxidizer Systems Carmen L. Bellanca, Ival O. Salyer, Jay C. Harris, 1963 Elastomeric and plastic O ring seals were exposed to liquid and vapor phases of nitrogen tetroxide chlorine trifluoride 1 1 mixture of hydrazine unsymmetrical dimethylhydrazine and 90% hydrogen peroxide under in use conditions Materials included polyethylene Teflon butyl ethylene propylene Vitons A and B were tested under compression in closed static system in direct contact with test fluid The rate of fluid loss through the seal was determined directly Text method and results are described Polyethylene encapsulated O rings and metal clad elastomeric O rings as seals for nitrogen tetroxide systems are also discussed page iii

Determination of Spring Modulus for Several Types of Elastomeric Materials (O-rings) and Establishment of an Open Database for Seals ,1995 Seals that provide the containment system interface between the packaging body and closure must function in high and low temperature environments under dynamic and static loading conditions and with different types of contained media It is one of the most critical elements in the container since the container fails to meet regulations if the seal does not function properly A research and testing program for seal materials was initiated at Sandia in 1988 with the goal of characterizing the behavior of seal materials commonly used in packages conditions as specified in the regulations NRC IOCFR Part 71 and American National Standards Institute ANSI 14 5 The performance of elastomeric seals in undeformed closures at both high and low temperatures has been investigated Bronowski 1995 Work has begun with this program to determine the response of elastomeric seals to fast acting dynamic deformations in the closure The response of elastomeric o ring seals during closure movements due to long term deformations has already been characterized What has not been well characterized are short term closure movements with durations of only a few milliseconds that result in the so called burp release Methods for generating this type of response in a repeatable manner had not been developed and standard leak detection equipment does not have a fast enough response time to measure these transient events One factor which affects the length of the burp is the ability of the o ring to quickly close the gap to prevent a significant leak The dynamic characteristics of the elastomeric o ring material including the dynamic spring modulus and internal damping are directly related to its ability to quickly close the gap A set of tests designed to determine the dynamic properties for various material types and durometers hardness of elastomers that were both lubricated and dry at ambient temperature were conducted

Gland Design, O-Ring and Other Elastomeric Seals, Static Applications A-6C2 Seals Committee,2022 This SAE Aerospace Standard AS provides standardized gland groove design criteria and dimensions for elastomeric seal glands for static applications The glands have been specifically designed for applications using SAE AS568 size O rings at pressures exceeding 1500 psi 10 3 MPa utilizing one or two anti extrusion backup rings and applications at pressures under 1500 psi 10 3 MPa without backup rings The glands have been sized to provide increased squeeze as compared to AS4716 for more effective sealing at low temperatures and low seal swell conditions These glands are not recommended for dynamic use Primary usage is for static external sealing The rod dimensions are the same as AS4716 The cylinder bore dimensions are the same as AS4716 except for sizes 001 thru 011 and 104 thru 113 AS5857A has been reaffirmed to comply with the SAE Five Year Review policy
