Connection Over Fixed Piers M. Ala Saadeghvaziri, 2004 To improve structural efficiency of multi span simply supported bridges partial and or full continuity is provided through cast in place concrete diaphragms and decks These bridges known as Simple Span Precast Prestressed Bridge Girders Made Continuous are continuous for live loads This continuity connection is also beneficial from maintenance point of view by eliminating open joints However continuity connections also have their own structural construction and maintenance shortcomings Development of positive moments and diaphragm cracking at the internal pier due to time dependent effects of prestressing is a major structural problem that also affects bridge durability and esthetics Another issue is that due to reinforcement congestion joint construction is time consuming and thus expensive Furthermore the degree of continuity varies depending on structural and construction conditions These problems are common to various design details used by many states in the US

A Precast Substructure Design for Standard Bridge Systems Sarah Longstreth Billington, Robert W. Barnes, John Edward Breen, 1999 The proposed substructure system described in this report has been developed to improve the aesthetics and reduce the construction time of the support structures for standard bridges The form of the proposed substructures is highly attractive and is a distinct improvement over many traditional short and medium span bridge substructures The substructure system developed is particularly well suited for precasting although the geometric form could be cast in situ Precasting would result in the increased use of high performance concrete in the substructures The use of such concrete will bring improved durability since the high performance concrete is greatly resistant to ingress of moisture and chlorides In addition the greater compressive strength of the high performance concretes is utilized for reducing the handling weight and dead load of the substructure units The bent cap units are more complex than traditional cast in place bent caps but appear feasible for plant production or large scale cast on site projects

Evaluating the Time-dependent Deformations and Bond Characteristics of a Self Consolidating Concrete Mix and the Implication for Pretensioned Bridge Applications Kyle H. Larson, 2007 Results of an extensive experimental program conducted to determine the material bond characteristics and time dependent deformations of a proposed self consolidating concrete SCC mixture for bridge girders are presented This research program was completed in three phases The first phase consisted of 15 full scale pretensioned SCC flexural specimens tested to evaluate their transfer and development lengths These specimens included both single strand and multiple strand beams as well as specimens designed to evaluate the so called top strand effect The top strand specimens with more than 20 inches of concrete below the strand were tested to evaluate the current American Association of State Highway and Transportation Officials requirement of a 30% increase in the development length when the concrete below the strand is more than 12 inches Strand end slip measurements used to estimate transfer lengths indicated the

proposed SCC mixture meets ACI and AASHTO requirements In addition flexural tests confirmed the proposed SCC mixture also meets current code requirements for development length The second phase was to evaluate the elastic shortening creep and shrinkage properties of the proposed SCC mixture for bridge girders Four bridge girders with an inverted T profile were used to measure these time dependent deformations In two of the specimens the strands were tensioned to 75% of the ultimate tensile strength simulating a girder at service Strands of the other two specimens were left untensioned to evaluate shrinkage effect of the concrete alone The shrinkage was then subtracted from the fully tensioned specimens and elastic shortening and creep were isolated after relaxation losses were calculated from code expressions In addition the fully tensioned specimens were used to determine transfer lengths of the prestressing strand The final phase of the program was to record strain measurements of the actual bridge girders used in the field Elastic shortening creep and shrinkage prestress losses of the proposed SCC mixture were compared with current design equations Instrumentation of seven pretensioned girders in a five span bridge located in Cowley County Kansas was used to measure time dependent deformations Three of these girders utilized SCC while the other four were cast with conventional concrete Bridge Maintenance, Safety, Management, Life-cycle Performance and Cost Paulo J.
