Electrocardiogram ECG is a noninvasive technology widely used in health care systems for diagnosis of heart diseases and a wearable ECG sensor with long term monitoring is necessary for real time heart disease detection However the conventional ECG is restricted considering the physical size and power consumption of the system In this thesis we propose a Wireless ECG System with Bluetooth Low Energy BLE and Compressed Sensing CS The proposed Wireless ECG System includes an ECG sensor board based on a BLE chip an Android application and a web service with a database The ECG signal is first collected by the ECG Sensor Board and then transmitted to the Android application through BLE protocol At last the ECG signal is uploaded to the cloud database from the Android app We also introduce Compressed Sensing into our system with a novel sparse sensing matrix data compression and a modified Compressive Sampling Matching Pursuit CoSaMP reconstruction algorithm Experiment results show that the amount of data transmitted is reduced by about 57% compared to not using Compressed Sensing and reconstruction time is 64% less than using Orthogonal Matching Pursuit OMP or Iterative Re weighted Least Squares IRLS algorithm *Body Sensors and Electrocardiography* Roman Trobec,Ivan Tomašić,Aleksandra Rashkovska,Matjaž Depolli,Viktor Avbelj,2017-07-12 This monograph presents a comprehensive overview of the electrocardiography from the aspect of wireless and mobile monitoring and its potential for personalized health management The topical focus is on the implementation and efficient application of user friendly m Health systems The target audience comprises biomedical engineers medical doctors students industrial experts and health managers developing m Health solutions **Wearable/Personal Monitoring Devices Present to Future** Gaetano D. Gargiulo,Ganesh R. Naik,2021-10-26 This book discusses recent advances in wearable technologies and personal monitoring devices covering topics such as skin contact based wearables electrodes non contact wearables the Internet of things IoT and signal processing for wearable devices Although it chiefly focuses on wearable devices and provides comprehensive descriptions of all the core principles of personal monitoring devices the book also features a section on devices that are embedded in smart appliances furniture e g chairs which despite their limitations have taken the concept of unobtrusiveness to the next level Wearable and personal devices are the key to precision medicine and the medical community is finally exploring the opportunities offered by long term monitoring of physiological parameters that are collected during day to day life without the bias imposed by the clinical environment Such data offers a prime view of individuals physical condition as well as the efficacy of therapy and occurrence of events Offering an in depth analysis of the latest advances in smart and pervasive wearable devices particularly those that are unobtrusive and invisible and addressing topics not covered elsewhere

the book will appeal to medical practitioners and engineers alike      *Non-contact Biopotential Sensing* Yu Mike Chi,2011

Ubiquitous physiological monitoring will be a key driving force in the upcoming wireless health revolution Cardiac and brain signals in the form of ECG and EEG are two critical health indicators that directly benefit from long term monitoring Despite advancements in wireless technology and electronics miniaturization however the use of wireless home ECG EEG monitoring is still limited by the inconvenience and discomfort of wet contact electrodes This research focuses on the development of non contact electrodes which do not require direct electrical skin contact as a patient friendly alternative and begins with a review of the field Early attempts at building non contact sensors using off the shelf commercial components demonstrated the feasibility of building low cost wireless wearable ECG and EEG monitoring systems As part of this early work it was discovered that the interface noise from the insulating medium between body and sensor was often dominant contributing significant new knowledge in this field Further research revealed that discrete amplifiers contained many limitations especially regarding frequency response and noise that were difficult to surmount Previous implementations known in the literature required extensive manual tuning and calibration in order to boost the input impedance of discrete amplifiers an imperfect and tedious process To overcome the challenges with using discrete components a fully custom analog sensor front end was developed achieving input impedances and frequency responses far exceeding than what was previously possible all completely without the need for manual adjustment Validation of this sensor in ECG applications show that it easily meets medical grade frequency response specifications and attains closer signal correlation to adhesive wet electrodes Neural applications of this sensor were also explored and validated within an EEG steady state visual evoked potential brain computer interface and benchmarked against dry and wet sensors Successful real time control of a computer to a degree never before demonstrated with non contact sensors was achieved with the electrodes placed on top of hair completely without gels or skin preparation Additional sensor applications including EOG eye tracking and low power integrated focal plane video compression are also discussed
