Here we cover the evolution of the field since 1980 in parallel computers ranging from the Cyber 205 to clusters now approaching an exaflop to multicore microprocessors and Graphic Processing Units GPUs in commodity personal devices parallel programming notations such as OpenMP MPI message passing and CUDA streaming notation and seven parallel applications such as finite element analysis and computer vision Some things that looked like they would be major trends in 1981 such as big Single Instruction Multiple Data arrays disappeared for some time but have been revived recently in deep neural network processors There are now major trends that did not exist in 1980 such as GPUs distributed memory machines and parallel processing in nearly every commodity device This book is intended for those that already have some knowledge of parallel processing today and want to learn about the history of the three areas In parallel hardware every major parallel architecture type from 1980 has scaled up in performance and scaled out into commodity microprocessors and GPUs so that every personal and embedded device is a parallel processor There has been a confluence of parallel architecture types into hybrid parallel systems Much of the impetus for change has been Moore's Law but as clock speed increases have stopped and feature size decreases have slowed down there has been increased demand on parallel processing to continue performance gains In programming notations and compilers we observe that the roots of today's programming notations existed before 1980 And that through a great deal of research the most widely used programming notations today although the result of much broadening of these roots remain close to target system architectures allowing the programmer to almost explicitly use the target's parallelism to the best of their ability The parallel versions of applications directly or indirectly impact nearly everyone computer expert or not and parallelism has brought about major breakthroughs in numerous application areas Seven parallel applications are studied in this book [High Performance Computing](#) Heike Jagode, Hartwig Anzt, Hatem Ltaief, Piotr Luszczek, 2021-11-12 This book constitutes the refereed post conference proceedings of 9 workshops held at the 35th International ISC High Performance 2021 Conference in Frankfurt Germany in June July 2021 Second International Workshop on the Application of Machine Learning Techniques to Computational Fluid Dynamics and Solid Mechanics Simulations and Analysis HPC IODC HPC I/O in the Data Center Workshop Compiler assisted Correctness Checking and Performance Optimization for HPC Machine Learning on HPC Systems 4th International Workshop on Interoperability of Supercomputing and Cloud Technologies 2nd International Workshop on Monitoring and Operational Data Analytics 16th Workshop on Virtualization in High Performance Cloud Computing Deep Learning on Supercomputers 5th International Workshop on In Situ Visualization The 35 papers included in this volume were carefully reviewed and selected They cover all aspects of research development and application of large scale high performance experimental and commercial systems Topics include high performance computing HPC computer architecture and hardware programming models system software performance analysis and modeling compiler analysis and optimization techniques software sustainability scientific applications deep learning Chapter Machine Learning Based Control of Perturbed and
