Intrusion Detection System Using Datamining Techniques:

Feature Selection for Intrusion Detection Systems Kumar Yogesh,Kumar Krishan,Kumar Gulshan,2014-01 Network security is a serious global concern The increasing prevalence of malware and incidents of attacks hinders the utilization of the Internet to its greatest benefit and incur significant economic losses The traditional approaches in securing systems against threats are designing mechanisms that create a protective shield almost always with vulnerabilities This has created Intrusion Detection Systems to be developed that complement traditional approaches However with the advancement of computer technology the behavior of intrusions has become complex that makes the work of security experts hard to analyze and detect intrusions In order to address these challenges data mining techniques have become a possible solution However the performance of data mining algorithms is affected when no optimized features are provided This is because complex relationships can be seen as well between the features and intrusion classes contributing to high computational costs in processing tasks subsequently leads to delays in identifying intrusions Feature selection is thus important in detecting intrusions by allowing the data mining system to focus on what is really important *Applications of Data Mining in Computer Security* Daniel Barbará,Sushil Jajodia,2002-05-31 Data mining is becoming a pervasive technology in activities as diverse as using historical data to predict the success of a marketing campaign looking for patterns in financial transactions to discover illegal activities or analyzing genome sequences From this perspective it was just a matter of time for the discipline to reach the important area of computer security Applications Of Data Mining In Computer Security presents a collection of research efforts on the use of data mining in computer security Data mining has been loosely defined as the process of extracting information from large amounts of data In the context of security the information we are seeking is the knowledge of whether a security breach has been experienced and if the answer is yes who is the perpetrator This information could be collected in the context of discovering intrusions that aim to breach the privacy of services data in a computer system or alternatively in the context of discovering evidence left in a computer system as part of criminal activity Applications Of Data Mining In Computer Security concentrates heavily on the use of data mining in the area of intrusion detection The reason for this is twofold First the volume of data dealing with both network and host activity is so large that it makes it an ideal candidate for using data mining techniques Second intrusion detection is an extremely critical activity This book also addresses the application of data mining to computer forensics This is a crucial area that seeks to address the needs of law enforcement in analyzing the digital evidence Applications Of Data Mining In Computer Security is designed to meet the needs of a professional audience composed of researchers and practitioners in industry and graduate level students in computer science **Intrusion Detection System Using Datamining Techniques** Shubha Puthran,Ketan Shah,2012-05 Security is a big issue for all networks including defense and government infrastructure Attacks on network infrastructure are threats against the information security The Intrusion detection system IDS is one that scans incoming

data activities and attempt to detect the intrusions The classification algorithms in IDS are used to categorize the well known large variety of intrusions In recent years data mining based IDS have executed good performance Still challenges exist in the design and implementation of quality IDSs The goal of this classification and clustering based IDS system is to decrease the False alarm rates and increase the accuracy   Improving Intrusion Detection Systems Using Data Mining Techniques Abdulrazaq Z. data mining for security and malware detection is quickly on the rise most books on the subject provide high level theoretical discussions to the near exclusion of the practical aspects Breaking the mold Data Mining Tools for Malware Detection provides a step by step breakdown of how to develop data mining tools for malware detection Integrating theory with practical techniques and experimental results it focuses on malware detection applications for email worms malicious code remote exploits and botnets The authors describe the systems they have designed and developed email worm detection using data mining a scalable multi level feature extraction technique to detect malicious executables detecting remote exploits using data mining and flow based identification of botnet traffic by mining multiple log files For each of these tools they detail the system architecture algorithms performance results and limitations Discusses data mining for emerging applications including adaptable malware detection insider threat detection firewall policy analysis and real time data mining Includes four appendices that provide a firm foundation in data management secure systems and the semantic web Describes the authors tools for stream data mining From algorithms to experimental results this is one of the few books that will be equally valuable to those in industry government and academia It will help technologists decide which tools to select for specific applications managers will learn how to determine whether or not to proceed with a data mining project and developers will find innovative alternative designs for a range of applications   *Machine Learning and Data Mining for Computer Security* Marcus A. Maloof,2006-02-27 Machine Learning and Data Mining for Computer Security provides an overview of the current state of research in machine learning and data mining as it applies to problems in computer security This book has a strong focus on information processing and combines and extends results from computer security The first part of the book surveys the data sources the learning and mining methods evaluation methodologies and past work relevant for computer security The second part of the book consists of articles written by the top researchers working in this area These articles deals with topics of host based intrusion detection through the analysis of audit trails of command sequences and of system calls as well as network intrusion detection through the analysis of TCP packets and the detection of malicious executables This book fills the great need for a book that collects and frames work on developing and applying methods from machine learning and data mining to problems in computer security   **Data Mining Approaches for Intrusion Detection** ,2000 In this paper we discuss our research in developing general and systematic methods for intrusion detection The key ideas are to use data mining techniques to discover consistent and useful patterns of system features that describe program and user behavior and use the set of relevant system features to compute inductively learned classifiers that can recognize anomalies and known intrusions Using experiments on the sendmail system call data and the network tcpdump data we demonstrate that we can construct concise and accurate classifiers to detect anomalies We provide an overview on two general data mining algorithms that we have implemented the association rules algorithm and the frequent episodes algorithm These algorithms can be used to compute the intra and inter audit record patterns which are essential in
