(BIM) Interoperability Mohammed Aldegeily, 2018 BIM has been playing an essential role in building construction projects in recent years It was used to automate many tasks such as clash detection 4D planning and quantity takeoff among others However the interoperability of BIM still lacks in many fields across the architecture engineering and construction domains This research studies the interoperability between architectural design and structural analysis The goal is to explore structural analysis of BIM models through data transfer processes between different software platforms via three types of paths 1 Application Programming Interface API 2 immediately connect which is the direct link between software programs from the same provider and 3 indirect link which is the indirect transfer of information through third party software or methods algorithms This research unfolds through examining and comparing the three paths with a special focus on the level of interoperability that can be achieved by using IFC data through the indirect link IFC are the ISO registered open and neutral data exchange standard for BIM Although IFC was designed to be comprehensive in supporting all disciplines and phases of a building construction project the author found that IFC exports from architectural design software usually lack essential information elements needed for structure analysis Recommendations are made to help improve the IFC based BIM interoperability between architectural design and structural analysis which would support collaboration between architects and structural engineers with a smooth transfer of modeling information with minimum information loss thus saving time and costs
