Introduction to Nonlinear Optimization gradually yet rigorously builds connections between theory algorithms applications and actual implementation The book contains several topics not typically included in optimization books such as optimality conditions in sparsity constrained optimization hidden convexity and total least squares Readers will discover a wide array of applications such as circle fitting Chebyshev center the Fermat Weber problem denoising clustering total least squares and orthogonal regression These applications are studied both theoretically and algorithmically illustrating concepts such as duality Python and MATLAB programs are used to show how the theory can be implemented The extremely popular CVX toolbox MATLAB and CVXPY module Python are described and used More than 250 theoretical algorithmic and numerical exercises enhance the reader s understanding of the topics More than 70 of the exercises provide detailed solutions and many others are provided with final answers The theoretical and algorithmic topics are illustrated by Python and MATLAB examples This book is intended for graduate or advanced undergraduate students in mathematics computer science electrical engineering and potentially other engineering disciplines

Introduction to Methods for Nonlinear Optimization Luigi Grippo,Marco Sciandrone,2023-05-27 This book has two main objectives to provide a concise introduction to nonlinear optimization methods which can be used as a textbook at a graduate or upper undergraduate level to collect and organize selected important topics on optimization algorithms not easily found in textbooks which can provide material for advanced courses or can serve as a reference text for self study and research The basic material on unconstrained and constrained optimization is organized into two blocks of chapters basic theory and optimality conditions unconstrained and constrained algorithms These topics are treated in short chapters that contain the most important results in theory and algorithms in a way that in the authors experience is suitable for introductory courses A third block of chapters addresses methods that are of increasing interest for solving difficult optimization problems Difficulty can be typically due to the high nonlinearity of the objective function ill conditioning of the Hessian matrix lack of information on first order derivatives the need to solve large scale problems In the book various key subjects are addressed including exact penalty functions and exact augmented Lagrangian functions non monotone methods

decomposition algorithms derivative free methods for nonlinear equations and optimization problems The appendices at the end of the book offer a review of the essential mathematical background including an introduction to convex analysis that can make part of an introductory course

Introduction to Nonlinear and Global Optimization Eligius M.T.
