Determining the Structure of the United States Marine Instrumentation Industry and Its Position in the World Industry James M. Broadus,1988 This report is a general but comprehensive description and analysis of industrial organization in the field of marine electronic instrumentation MEI a broadly defined industry which until now has received little systematic scholarly attention The report reviews the current literature on international trade and competitiveness as well as trade and scientific journals relevant to the industry The results of a series of interviews with representatives of the industry and responsible government agencies are presented and industry and government data on R 2 commercial marine electronics and 3 scientific instrumentation The first group is by far the largest in sales volume and is oligopolistic in structure consisting of a few large rivals for infrequent and complex defense systems contracts The other groups are more purely competitive Four major customer groups are distinguished 1 military 2 commercial and recreational shipping and boating 3 offshore oil and gas and 4 oceanographic environmental Most of the firms in the industry face international competition The importance of marine electronic instrumentation to technological advance and economic activity in the world's oceans is strongly apparent Parameters affecting the international competitiveness of firms in this industry including those relating to industry structure and behavior and governmental

such as healthcare smart cities smart grids energy distribution agriculture and even transportation In a typical IoT enabled network smart sensors are geographically distributed to collect and process data within a smart infrastructure using an open channel the Internet However the use of the Internet brings inherent vulnerabilities related to security e g IoT devices can be compromised using advanced hacking techniques and privacy e g adversary performing inference and data poisoning attacks Intrusion Detection System IDS and Cyber Threat Intelligence CTI are the two most extensively used techniques in IoT enabled networks to safeguard the integrity and availability of sensitive smart systems However the presence of a large volume of data i e dimensionality curse and cloud based centralized deployment mechanism hurts the IDS performance in terms of intrusion detection tasks and increased latency for data processing On the other hand modelling CTI is challenging due to the limited labels of cyber threat sources and analysing these sources to extract relevant threat information manually is a time consuming and error prone procedure that necessitates a large investment of resources This thesis provides substantial contributions to research on the building of a distributed IDS a hybrid feature selection approach an automated CTI Modelling and Identification scheme and a deep privacy encoding module for enhancing security and privacy of IoT enabled networks
