

HIERARCHICAL VS NETWORK VS RELATIONAL DATABASE MODEL

HIERARCHICAL

A structure of data organized in a tree like model using parent, child relationships

Arranges data in a tree similar structure

Represents "one to many" relationship

Difficult to access data

Less flexible

NETWORK

A database model that allows multiple records to be linked to the same owner file

Organizes data in a graph structure

Represents "many to many" relationship

Easier to access data

Flexible

RELATIONAL

A database model to manage data as tuples grouped into relations (tables)

Arranges data in tables

Represent both "one to many" and "many to many" relationships

Easier to access data

Flexible

Relational Database Systems Joachim W. Schmidt, Michael L. Brodie, 2012-12-06 After a long period of research development test and trial relational database management systems are at last being marketed in force The feedback from early installations of these systems is overwhelmingly positive The most frequent comment by users is that productivity has been increased by a significant factor from 5 to 20 times what it was using previous approaches Another comment is that in many cases end users can now handle their own problems by direct use of the system instead of using application programmers as mediators between them and the system As the reputation of relational systems for ease of use and enhanced productivity has grown there has been a strong temptation for vendors of other approaches to exploit the label relational somewhat indiscriminately In some cases the label is being misapplied to a whole data system in others it is being misapplied to an interface It is therefore worth developing criteria which database management systems DBMSs should have in order to be called relational The Relational Task Group RTG of the American National Standards Institute ANSI undertook such an effort by developing a characterization of RDBMSs and analyzing fourteen DBMSs per this characterization The result of this work is presented in this book The conclusions of the RTG are in agreement with my view that a DBMS should not be called relational unless it satisfies at least the following conditions 1 All information in the database is represented as values in tables

Database Modeling Step by Step Gavin Powell, 2020-01-06 With the aim of simplifying relational database modeling Database Modeling Step by Step presents the standard approach to database normalization and then adds its own approach which is a more simplistic intuitive way to building relational database models Going from basics to contemporary topics the book opens with relational data modeling and ends with BigData database modeling following a road map of the evolution in relational modeling and including brief introductions to data warehousing and BigData modeling A break down of the elements of a model explains what makes up a relational data model This is followed by a comparison between standard normalization and a more simplistic intuitive approach to data modeling that a beginner can follow and understand A brief chapter explains how to use the database programming language SQL Structured Query Language which reads from and writes to a relational database SQL is fundamental to data modeling because it helps in understanding how the model is used In addition to the relational model the last three chapters cover important modern world topics including denormalization that leads into data warehouses and BigData database modeling The book explains how there is not much to logical data modeling in BigData databases because as they are often schema less which means that BigData databases do not have schemas embedded into the database itself they have no metadata and thus not much of a logical data model Online bonus chapters include a case study that covers relational data modeling and are available at the author s web site www.oracletroubleshooter.com/datamodeling.html

Mátyás, 2018-04-30 Doctoral Thesis Dissertation from the year 2016 in the subject Environmental Sciences grade 5 National Autonomous University of Nicaragua language English abstract The primary goal of the present dissertation is to introduce a self developed data storage logic called Joker Tao JT which provides the opportunity to store and manage each input data in one physical data table while the data storage concept is structured JT allows any data whether entity attribute data connection or formula to be stored and managed under just one physical data table In the JT logic based databases the entity and the attribute are used interchangeably so users can expand the database with new attributes either during or after the development process With JT logic data storage using one physical data table is ensured in SQL database system for the storage and management of long term scientific information I examined the effects and importance of JT during some production stages of farm to table Namely the interoperability between soil and GHG production data from different data storage structures data relating to food stock records billing and payroll in the baking industry are examined in this dissertation With regard to development the results show that in case of 1000 records or more positive results significantly faster queries could be realized with JT model usage in cloud compared to relational databases in Oracle APEX environment The results show that from 10000 records the relational model generates slow more than 1 second queries in a cloud based environment while JT can remain within a one second time frame Farm to table refers to the stages of food production and is associated with sustainable agriculture Studies on climate change and greenhouse gas emissions linked to soil cultivation require large amounts of data These data are mainly inducted from laboratory measuring devices or from various systems including geographical information and other specific systems which operate with data from different data storage structures Operating with data from different data storage structures is a challenge for companies and research institutes Modern database management systems fall into two broad classes RDBMS and NoSQL The interoperability between SQL and NoSQL

often garners considerable attention in the world of databases with many solutions to have been proposed to solve this issue There are some initiations in the literature about converting systems I focused on creating a data storage logic which increases the performance of NoSQL data storage concept based RDBMS database management system
