Annual Review of Materials Research, 2010 **Colloidal Particles at Liquid Interfaces** Bernard P. Binks, Tommy S. Horozov, 2006-08-17 Small solid particles adsorbed at liquid interfaces arise in many industrial products and process such as anti foam formulations crude oil emulsions and flotation They act in many ways like traditional surfactant molecules but offer distinct advantages However the understanding of how these particles operate in such systems is minimal This book brings together the diverse topics actively being investigated with contributions from leading experts in the field After an introduction to the basic concepts and principles the book divides into two sections The first deals with particles at planar liquid interfaces with chapters of an experimental and theoretical nature The second concentrates on the behaviour of particles at curved liquid interfaces including particle stabilized foams and emulsions and new materials derived from such systems This collection will be of interest to academic researchers and graduate students in chemistry physics chemical engineering pharmacy food science and materials science **Dekker Encyclopedia of Nanoscience and Nanotechnology** James A. Structure and Functional Properties of Colloidal Systems Roque Hidalgo-Alvarez, 2017-06-16 Integrating fundamental research with the technical applications of this rapidly evolving field Structure and Functional Properties of Colloidal Systems clearly presents the connections between structure and functional aspects in colloid and interface science It explores the physical fundamentals of colloid science new developments of synthesis and conditioning and many possible applications Theory Divided into three parts the book begins with a discussion of the theoretical side of colloid dynamics It then transitions to dynamically arrested states and capillary forces in colloidal systems at fluid interfaces Structure Covering the structural aspects of different colloidal systems the second section examines electric double layers and effective interactions as well as the structure of extremely bimodal suspensions and filaments made up of micro-sized magnetic particles The contributors analyze the role played by the attractive interaction confinement and external fields on the structure of colloidal systems They also discuss structural aspects in food emulsions and the rheological properties of structured fluids Functional Materials The last part focuses on examples of functional colloids These include polymer colloids protein functionalized colloidal particles magnetic particles metallic nanoparticles micro and nanogels responsive microgels colloidal photonic crystals microfluidics gel glass dispersed liquid crystals GDLCs devices and nanoemulsions This volume

provides a sound understanding of the link between the structure and functional properties in two and three dimensional colloidal systems It describes techniques to functionalize colloids characterization methods the physical fundamentals of structure formation diffusion dynamics transport properties in equilibrium the physical fundamentals of nonequilibrium systems the measuring principles to exploit properties in applications the differences in designing lab experiments and devices and several application examples

Structure and Interactions of Colloidal Particles at Fluid Interfaces

Adam Daniel Law,2011 *Study on the Dynamic Behaviour of Colloidal Particles in Bidisperse Settling Suspensions and at Gas-liquid Interfaces* Hangyu Chen,2022 Collective Behavior of Colloidal Particles on Fluid Interface Shenghan Yan,2012

It is well known that charged colloidal particles may form an effective two dimensional suspension at a fluidic interface Research toward the understanding of the dynamics and collective behavior of these suspended particles is at the core of engineering Pickering emulsions which have a broad range of practical applications In the first half of this dissertation we will explore the single phase particle monolayer Although microscopic images and rheological measurements have been obtained in abundance the underlying physics behind the collective behavior of such systems is yet to be fully understood We started by examining the attractive and repulsive potentials in this system In the case of charged colloidal particles at a fluidic interface capillary attraction rises from the meniscus deformation which is predominantly due to the mismatch of dielectric constants between the aqueous phase and the non polar phase On the other hand aggregation is prevented by the long range Coulombic repulsion through the non polar phase as proposed by Aveyard and coworkers With the basic knowledge of interaction potentials present Monte Carlo simulation and Brownian dynamics simulation were performed assuming pair wise interactions with all physical constants of a system consisting of latex particles trapped at a water decane interface Microscopic images of such a system were recorded concurrently serving as an internal verification of the numerical simulation Furthermore the pair distribution function in the radial direction and the angular order parameter were extracted from the equilibrium configuration of the Monte Carlo simulation as well as real time microscopic images to investigate the phase transition behaviour The primitive simulation results agreed with the experimental observation qualitatively showing a two dimensional phase transition from a disordered phase to an ordered solid phase as the surface coverage of the particles increases In the second half of the dissertation we focus on the coalescence experiments involving a Pickering droplet Many experiments have been performed where two particle laden interfaces have been brought into close contact in a controlled manner and various observations including particle bridging have been made in an attempt to understand the stabilization mechanism of interfacial particles in a Pickering emulsion One of the most interesting observations is the tendency for the particles on one interface to evacuate and those on the other interface to aggregate during the close approach of the surfaces In this work we propose to understand the mechanism of particle evacuation aggregation via a combined experimental and theoretical approach First we performed real time experiments where two

particle laden water decane interfaces were brought into contact Many phenomena including particle evacuation aggregation and bridging were observed We then developed a Brownian dynamics simulation of the evacuation aggregation including the important relevant interparticle interactions that we presumed were important in describing the phenomena In order to do so we had to answer three questions First what are the relevant aspects of the charged particle interaction within the same interface Second what is the charge interaction across the two approaching interfaces Third what are the flow effects including the flow between the two interfaces during approach on the particle motion and how can we model such a flow Toward this goal we have incorporated both reasonable electric inter particle interactions from available literature studies and flow interactions via a porous media model that relates the particle velocity to the local surface coverage through the effective permeability of a porous media Thus the flow effects are captured in a mean field sense The BD simulations were able to capture the evacuation aggregation qualitatively and in most instances quantitatively In particular the diameter of the evacuated area decreases with increasing surface coverage in both simulations and experiments and we will describe the physical mechanisms leading to this behavior by analyzing the particle force balance in the BD simulations
