Global Security, Safety, and Sustainability Hamid Jahankhani, Ali G. Hessami, Feng Hsu, 2009-08-20 The Annual ICGS International Conference is an established platform in which security and sustainability issues can be examined from several global perspectives through dialogue between academics, students, government representatives, chief executives, security professionals, and research scientists from the United Kingdom and from around the globe. The 2009 two-day conference focused on the challenges of complexity, rapid pace of change, and risk/opportunity issues associated with modern products, systems, social events, and infrastructures. The importance of adopting systematic and systemic approaches to the assurance of these systems was emphasized within a special stream focused on strategic frameworks, architectures, and human factors. The conference provided an opportunity for systems scientists, assurance researchers, owners, operators, and maintainers of large, complex, and advanced systems and infrastructures to update their knowledge with the state-of-the-art best practice in these challenging domains while networking with the leading researchers and solution providers. ICGS3 2009 received paper submissions from more than 20 different countries around the world. Only 28 papers were selected and were presented as full papers. The program also included three keynote lectures by leading researchers, security professionals, and government representatives. June 2009 Hamid Jahankhani, Ali Hessami, Feng Hsu

**Unsupervised Feature Selection for Anomaly-based Network Intrusion Detection Using Cluster Validity Indices** Tyrone Naidoo,2016

**Unsupervised Density- and Anomaly-based Intrusion Detector in Networks** Eric Lim,2016 To protect the integrity and security of networks experts and researchers are constantly improving ways to capture network based threats As the security systems advance towards efficient and effective recognition of such

threats exploiters and malicious users introduce novel attacks unknown to the society to circumvent the defensive systems Novel threats are difficult to detect and capture due to a lack of information initially but they must not be disregarded until sufficient information is gathered to help identify them A capable security system should not only be able to detect previously known attacks but also possess abilities to detect unknown novel attacks We propose a method in which the novel attacks can be detected without prior knowledge or presumption of their intentions and purposes Our method is based on 1 unsupervised anomaly detection algorithms that do not require labels in data which makes it a useful exploratory tool for finding potential novel threats in the given data and 2 local density algorithms such as LOF and DBSCAN to robustly analyse data while not being affected by the arbitrary shapes of the data Our method implements a two phase structure to mitigate one of the main caveats of an unsupervised anomaly detection task that is relative underperformance in comparison to its supervised and semi supervised counterparts We evaluate each phase of our method as well as the whole using KDD 99 data to show that it works as designed and compare the results against other possible methods to report the strengths and weaknesses of our method In our experiments our proposed method was able to detect between 95% and 98% of intrusions on average from one dataset of KDD 99 and about 88% of intrusions from another which suggests that our method is accurate The standard deviations of our results were extremely small to suggest that our method is also precise Our method was able to outperform clustering based and PCA based approaches in terms of both accuracy and precision

*MULTI-LEVEL ANOMALY BASED AUTONOMIC INTRUSION DETECTION SYSTEM.* ,2008 The rapid growth and deployment of network technologies and Internet services has made security and management of networks a challenging research problem This growth is accompanied by an exponential growth in the number of network attacks which have become more complex more organized more dynamic and more severe than ever Current network protection techniques are static slow in responding to attacks and inefficient due to the large number of false alarms Attack detection systems can be broadly classified as being signature based classification based or anomaly based In this dissertation I present a multi level anomaly based autonomic network defense system which can efficiently detect both known and unknown types of network attacks with a high detection rate and low false alarms The system uses autonomic computing to automate the control and management of multi level intrusion detection system and integrate the different components of the system The system defends the network by detecting anomalies in network operations that may have been caused by network attacks Like other anomaly detection systems AND captures a profile of normal network behavior In this dissertation I introduce experimental results that evaluate the effectiveness and performance of the multi level anomaly based autonomic network intrusion detection system in detecting network attacks The system consist of monitoring modules feature aggregation and correlation modules behavior analysis modules decision fusion module global visualization module risk and impact analysis module action module attack classification module and the adaptive learning module I have successfully implemented a prototype

system based on my multi level anomaly based approach The experimental results and evaluation of our prototype show that our multi level intrusion detection system can efficiently and effectively detect and protect against any type of network attacks known or unknown in real time Furthermore the overhead of our approach is insignificant on the normal network operations and services

**Understanding Intrusion Detection through Visualization** Stefan Axelsson, David Sands, 2006-06-01 This monograph is the outgrowth of Stefan Axelsson's PhD Dissertation at Chalmers University in Göteborg, Sweden The dissertation in turn collects a number of research efforts performed over a period of six years or so into a coherent whole It was my honor to serve as the opponent at Dr Axelsson's examination In the Swedish system it is the job of the opponent to place the candidate's work into a broader perspective demonstrating its significance and contributions to the field and then to introduce the work to the attendees at the examination This done the candidate presents the technical details of the work and the opponent critiques the work giving the candidate the opportunity to defend it This forward is adapted from the introduction that I gave at the examination and should serve to acquaint the reader not only with the work at hand but also with the field to which it applies The title of the work **Understanding Intrusion Detection Through Visualization** is particularly telling As is the case with any good piece of research we hope to gain an understanding of a problem not just a recipe or simple solution of immediate but limited utility For much of its formative period computer security concentrated on developing systems that in effect embodied a fortress model of protection

**Anomaly Detection as a Service** Danfeng (Daphne) Yao, Xiaokui Shu, Long Cheng, Salvatore J. Stolfo, 2017-10-24 Anomaly detection has been a long standing security approach with versatile applications ranging from securing server programs in critical environments to detecting insider threats in enterprises to anti abuse detection for online social networks Despite the seemingly diverse application domains anomaly detection solutions share similar technical challenges such as how to accurately recognize various normal patterns how to reduce false alarms how to adapt to concept drifts and how to minimize performance impact They also share similar detection approaches and evaluation methods such as feature extraction dimension reduction and experimental evaluation The main purpose of this book is to help advance the real world adoption and deployment anomaly detection technologies by systematizing the body of existing knowledge on anomaly detection This book is focused on data driven anomaly detection for software systems and networks against advanced exploits and attacks but also touches on a number of applications including fraud detection and insider threats We explain the key technical components in anomaly detection workflows give in depth description of the state of the art data driven anomaly based security solutions and more importantly point out promising new research directions This book emphasizes on the need and challenges for deploying service oriented anomaly detection in practice where clients can outsource the detection to dedicated security providers and enjoy the protection without tending to the intricate details
