Modeling and Control of Managed Pressure Drilling Operations Adrian Marius Ambruş, 2017 The upstream oil and gas industry has witnessed a marked increase in the number of wells drilled in areas with elevated subsurface formation pressures and narrow drilling margins Managed Pressure Drilling MPD techniques have been developed to deal with the challenge of narrow margin wells offering great promise for improved rig safety and reduced non productive time Automation of MPD operations can ensure improved control over wellbore pressure profiles and there are several commercial solutions currently available However these automation efforts seldom take into account the uncertainty and complex dynamics inherent in subsurface environments and usually assume ideally functioning sensors and actuators which is rarely the case in real world drilling operations This dissertation describes a set of tools and methods that can form the basis for an automation framework for MPD systems with specific focus on the surface back pressure technique of MPD Model based control algorithms with robust reference tracking as well as methods for detecting system faults and handling modeling uncertainty are integrated with a novel multi phase hydraulics model The control system and event detection modules are designed using physics based representations of the drilling processes as well as models relating uncertain variables in a probabilistic fashion Validation on high fidelity simulation models is conducted in order to ascertain the effectiveness of the developed methods

Safety and Reliability Assessment of Managed Pressure Drilling in Well Control Operations Idris Olusola Sule, 2019 Managed pressure drilling MPD is a technique utilized in drilling to manage annular pressure hold reservoir influx and divert mud returns away safely from the rig floor through a closed loop system Thus MPD plays key roles in well control operations and in drilling deepwater wells However despite the operational safety and economic benefits limited information is available on understanding the complexity of MPD system Furthermore the oil and gas industry currently relies on a flow monitoring system for earlier kick detection but faces severe flaws and limited progress has been made on approach that monitors kick from downhole due to the complexity of offshore drilling operations Thus the main objective of this research is to assess the safety and reliability of MPD In this research following novel contributions have been made several dynamic downhole drilling parameters have been identified to enhance earlier kick detection technique during drilling including about 33 89% damping of bit rock vibrations due to gas kick a reliability assessment model has been developed to estimate the failure probability of an MPD system as 5 74% the assess the increase in reliability of kick control operation increases from 94% to 97% due to structural modification of the MPD components identify that MPD operational failure modes are non sequential and identify that an MPD control system is the most safety critical components in an MPD system an automated MPD control model which implements a nonlinear model predictive controller NMPC and a two phase hydraulic flow model has been developed to perform numerical simulations of an MPD operation and lastly an integrated dynamic blowout risk model DBRM to assess the safety during an MPD operation has been developed and its operation involves three key steps a dynamic Bayesian network DBN model a numerical simulation of an

MPD control operation and dynamic risk analysis to assess the safety of the well control operation as drilling conditions change over time The DBRM also implemented novel kick control variables to assess the success failure of an MPD operation i e its safety and are instrumental in providing useful information to predict the performance of diagnose the failure of an MPD operation and has been successfully applied to replicate the dynamic risk of blowout risk scenarios presented in an MPD operation at the Amberjack field case study from the Gulf of Mexico

Managed Pressure Drilling Sagar Nauduri, 2012 Managed Pressure Drilling MPD one of the advanced techniques in the Drilling and Petroleum Industry currently at the top of the drilling technology evolution pyramid is a collection of tested drilling techniques and variations MPD when properly engineered and executed in most of the scenarios can help mitigate several drilling issues and improve personal and environmental safety However not all wells with drilling issues and or problems need MPD Proper screening of potential candidates with utmost diligence is required prior to electing to use MPD Any technology let alone MPD new or old simple or complex expensive or cheap should not be applied without thorough understanding and careful evaluation of the entire process Technology used for wrong reasons with incomplete comprehension and half hearted assessment and analysis is bound to give wrong sometimes even catastrophic results This work a research submitted to Texas A M in 2009 freely downloadable from www.tamu.edu is an attempt to provide basic steps in the candidate selection and evaluation while screening for MPD applications Basic understanding of Drilling and Petroleum Engineering will help

Design, Development and Control of a Managed Pressure Drilling Setup Al Amin, 2017 Drilling in challenging conditions require precise control over hydrodynamic parameters for safer and efficient operation in oil and gas industries Automated managed pressure drilling MPD is one of such drilling solution which helps to

maintain operational parameters effectively over conventional drilling technique The main goal is to maintain bottomhole pressure between reservoir formation pressure and fracture pressure with kick mitigation ability Real life MPD system has to confront nonlinearity induced by drilling fluid rheology and flow parameters To obtain a better understanding of this operation a lab scale experimental setup has been developed Reynolds number and pressure drop per unit length were considered to obtain hydrodynamic similarity A vertical concentric pipe arrangement has been used to represent the drill string and annular casing region A linearized gain switching proportional integral PI controller and a nonlinear model predictive controller NMPC have been developed to automate the control operation in the experimental setup A linearizer has been designed to address the choke nonlinearity Based on the flow and pressure criteria a gain switching PI controller has been developed which is able to control pressure and flow conditions during pipe extension pump failure and influx attenuation cases On the other hand a nonlinear Hammerstein Weiner model has been developed which assists in bottomhole pressure estimation using pump flow rate and choke opening The identified model has been integrated with a NMPC algorithm to achieve effective control within predefined pressure and flow constraints Lastly a performance comparison has been provided between the linearized gain switching PI controller and NMPC controller

Real Time Kick Estimation and Monitoring in Managed Pressure Drilling System M. Musab Habib,2020 The influx of reservoir fluid kick has a significant impact on drilling operations Unmitigated kick can lead to a blowout causing financial losses and impacting human lives on the rig Kick is an unmeasured disturbance in the system and so detection estimation and mitigation are essential for the safety and efficiency of the drilling operation Our main objective is to develop a real time warning system for a managed pressure drilling MPD system In the first part of the research an unscented Kalman filter UKF based estimator was implemented to simultaneously estimate the bit flow rate and kick The estimated kick is further used to predict the impact of the kick Optimal control theory is used to calculate the time to mitigate the kick in the best case scenario An alarm system is developed based on total predicted influx and pressure rise in the system and compared with actual well operation control matrix Thus the proposed method can estimate monitor and manage kick in real time enhancing the safety and efficiency of the MPD operation So a robust warning framework for the operators based on real life operational conditions is created in the second part of the research Proposed frameworks are successfully validated by applying to several case

studies *Managed Pressure Drilling* Mahdi Kalantari Meybodi, Jamshid Moghadasi, 2016-07-09 **Nonlinear Model Predictive Control for a Managed Pressure Drilling with High-fidelity Drilling Simulators** Junho Park, 2018 The world's energy demand has been rapidly increasing and is projected to continue growing for at least the next two decades. With increasing global energy demand and competition from renewable energy, the oil and gas industry is striving for more efficient petroleum production. Many technical breakthroughs have enabled the drilling industry to expand the exploration to more difficult drilling, such as deepwater drilling and multilateral directional drilling. For example, managed pressure drilling (MPD) offers ceaseless operation with multiple manipulated variables (MV) and wired drill pipe (WDP) provides two-way high-speed measurements from bottom hole and along string sensors. These technologies have maximum benefit when applied in an automation system or as a real-time advisory tool. The objective of this study is to investigate the benefit of nonlinear model-based control and estimation algorithms with various types of models. This work presents a new simplified flow model (SFM) for bottomhole pressure (BHP) regulation in MPD operations. The SFM is embedded into model-based control and estimation algorithms that use model predictive control (MPC) and moving horizon estimation (MHE) respectively. This work also presents a new Hammerstein-Wiener nonlinear model predictive controller for BHP regulation. Hammerstein-Wiener models employ input and output static nonlinear blocks before and after linear dynamics blocks to simplify the controller design. The control performance of the new Hammerstein-Wiener nonlinear controller is superior to conventional PID controllers in a variety of drilling scenarios. Conventional controllers show severe limitations in MPD because of the interconnected multivariable and nonlinear nature of drilling operations. BHP control performance is evaluated in scenarios such as drilling pipe connection kick attenuation and mud density displacement, and the efficacy of the SFM and Hammerstein-Wiener models is tested in various control schemes applicable to both WDP and mud pulse systems. Trusted high-fidelity drilling simulators are used to simulate well conditions and are used to evaluate the performance of the controllers using the SFM and Hammerstein-Wiener models. The comparison between non-WDP semi-closed loop and WDP full-closed loop applications validates the accuracy of the SFM under the set of conditions tested and confirms comparability with model-based control and estimation algorithms. The SFM-MPC maintains the BHP within 1 bar of the setpoint for each investigated scenario, including for pipe connection and mud density displacement procedures that experience a wider operation range than normal drilling. *Applied Gaseous Fluid Drilling Engineering* Boyun Guo, Yingfeng Meng, Na Wei, 2021-09-23 *Applied Gaseous Fluid Drilling Engineering: Design and Field Case Studies* provides an introduction on the benefits of using gaseous fluid drilling engineering. In addition, the book describes the multi-phase systems needed, along with discussions on stability control. Safety and economic considerations are also included, as well as key components of surface equipment needed and how to properly select equipment depending on the type of fluid system. Rounding out with proven case studies that demonstrate good practices and lessons from failures, this book delivers a practical tool for understanding

hole section The current research simulates the drilling conditions in aerated mud in order to obtain the best results via drilling at open hole conditions and comparing the results with conventional drilling operations It suggests an alternative solution via drilling with mist and foam mud as well as simulating these drilling fluids aerated mist and foam with additional surface back pressure SBP Furthermore it provides a comparative analysis between Conventional or Overbalanced Drilling OBD Performance Drilling PD Underbalanced Drilling UBD as well as Managed Pressure Drilling MPD In order to acquire a more precise work for the complicated calculations associated with the multi phase mixture compressible fluids two licensed software are used to carry out the simulation for the research under Weatherford company supervision Wellflow which is a software that belongs to Neo Tec Schlumberger is used to simulate for aerated mud in both drilling scenarios With SBP and Without SBP On the other hand WUNDERDRILL which is software that belongs to Weatherford is used to simulate for mist and foam in both drilling scenarios With SBP and Without SBP AutoCAD is used to sketch the drilling flow chart which summarizes the drilling process related to different scenarios based on the results and analysis obtained It was concluded that drilling with foam via implementing additional surface back pressure SBP Scenario B in an underbalanced situation will provide the best results in comparison with mist foam at open hole conditions without SBP Scenario A and aerated mud in both scenarios With SBP and without SBP as well as conventional drilling particularly for minimizing the loss in circulation and enhancing the rate of penetration ROP It was also found out that drilling via aerated mud with additional surface back pressure SBP enables further precise control on the wellbore instability issues as well as influxes

Advanced Control of Managed Pressure Drilling Anirudh Nandan,2016 Automation of managed pressure drilling MPD enhances the safety and increases efficiency of drilling and that drives the development of controllers and observers for MPD The objective is to maintain the bottom hole pressure BHP within the pressure window formed by the reservoir pressure and fracture pressure and also to reject kicks Practical MPD automation solutions must address the nonlinearities and uncertainties caused by the variations in mud flow rate choke opening friction factor mud density etc It is also desired that if pressure constraints are violated the controller must take appropriate actions to reject the ensuing kick The objectives are addressed by developing two controllers a gain switching robust controller and a nonlinear model predictive controller NMPC The robust gain switching controller is designed using H1 loop shaping technique which was implemented using high gain bumpless transfer and 2D look up table Six candidate controllers were designed in such a way they preserve robustness and performance for different choke openings and flow rates It is demonstrated that uniform performance is maintained under different operating conditions and the controllers are able to reject kicks using pressure control and maintain BHP during drill pipe extension The NMPC was designed to regulate the BHP and contain the outlet flow rate within certain tunable threshold The important feature of that controller is that it can reject kicks without requiring any switching and thus there is no scope for shattering due to switching between pressure and flow control That is achieved by exploiting the constraint handling capability of

NMPC Active set method was used for computing control inputs It is demonstrated that NMPC is able to contain kicks and maintain BHP during drill pipe extension *Egentlige Relation aff Londen, om den Kongelig Croning Caroli II. som skeede den 26. Aprilis 1661*, 1661
