NFPA 850

Recommended Practice for Fire Protection for Electric Generating Plants and High Voltage Direct Current Converter Stations

2010 Edition

Reference: 3.3.26, 3.3.27, and 7.2

TIA 10-2

(SC 10-10-8/TIA Log #1004)

Pursuant to Section 5 of the NFPA Regulations Governing Committee Projects, the National Fire Protection Association has issued the following Tentative Interim Amendment to NFPA 850, *Recommended Practice for Fire Protection for Electric Generating Plants and High Voltage Direct Current Converter Stations*, 2010 edition. The TIA was processed by the Technical Committee on Electric Generating Plants, and was issued by the Standards Council on October 20, 2010, with an effective date of November 9, 2010.

A Tentative Interim Amendment is tentative because it has not been processed through the entire standards-making procedures. It is interim because it is effective only between editions of the standard. A TIA automatically becomes a proposal of the proponent for the next edition of the standard, as such, it then is subject to all of the procedures of the standards-making process.

1. Add new definitions as follows:

3.3.26 Gas Purging. The act of replacing air in a fuel gas pipeline with gas by direct replacement so rapidly that a minimum of mixing between the two gases occurs.

3.3.27 Gas Blowing. The act of cleaning a fuel gas pipeline using high pressure/velocity fuel gas.

2. Revise 7.2 to read as follows:

7.2 Fuel Handling — Gas.

7.2.1* General. The storage and associated piping systems for gases in the gaseous or liquefied states should comply with ASME B 31.1, *Power Piping*; NFPA 54, *National Fuel Gas Code*; NFPA 55, *Compressed Gases and Cryogenic Fluids Code*; and NFPA 58, *Liquefied Petroleum Gas Code*. For pressures exceeding the scope of the aforementioned documents, refer to ASME B 31.8-2010, *Gas Transmission and Distribution Piping Systems*.

A.7.2.1 NFPA 54, National Fuel Gas Code, provides guidance for the design, installation, and testing of applications operating at pressures less than 125 psig (861.8 kPa), such as hot water heaters, space heaters, cooling applications, auxiliary boilers and emergency generators, and should be considered a good reference for these type applications in power generating facilities. NFPA 54 specifically excludes piping in electric utility power plants that supplies gas utilized directly as the fuel in the generation of electricity. These systems typically operate at pressures greater than 125 psig (861.8 kPa) which is beyond the scope of NFPA 54.

7.2.2 Shutoff Valve. The plant's main and igniter natural gas shutoff valve should be located near an exterior wall. The valve should be provided with both manual and automatic closing capabilities locally, and remote closing capability from the control room. The valve should be arranged to fail closed on the loss of power or pneumatic control.
