necessary for inter network communication in practice today manifested as naming with the DNS protocol suite and numbering with the BGP protocol suite Both dimensions follow similar design characteristics the design of the technical Internet is similar to the design of the coordination of the Internet These design principles which are well aligned with software design principles is the cause of the Internet s layered design separation of concerns in practice and minimal view of coordination the least coordinated Internet In general terms it is fruitful to view the Internet and involved actors as an ecology rather than one organization or entity in need of governance or control The second study looks at the social resilience of the Internet That is is it possible through social means to change what the Internet is or can be viewed as I use social resilience as a counterpart to technical resilience i e resilience to technical interference In essence the bottom up and separations of concerns design of the coordination aspect of the Internet minimizes possible influence of actors intent on mission disruption I also practically show that even a take over of the central councils have little effect the constituency of the Internet since these councils are not invested with formal powers of enforcement This thesis suggests that the cost of switching from ICANN and IETF to another set of organizations is quite low due to the nature of the coordination of the Internet compared to for example switching all equipment to IPv6 capable equipment However the current political situation is a threat to the current Internet regime since an international and rule based world order is no longer on all states agendas The final empirical study focus on the practical and theoretical implications of the Internet on the case of net neutrality The primary contribution is that de facto and de jure net neutrality differ in practice and as such de facto net neutrality deserves more attention Also I suggest that any regulation either for or against net neutrality is problematic since such regulation would interfere with the inherent coordination mechanisms of the Internet As such regulation should focus on providing the necessary markets for Internet function given the coordination and design of the Internet As a net neutrality example net neutral Internet access options should exist as part of a natural service offering if wanted by customers not due to direct regulation Throughout the thesis I identify two colliding world orders both in terms of digital communication networks and terms of organizing society in general the rule based and coordinating order with its champions and the integrated or sovereign order with its champions In practical terms the Internet can be considered a want in the former the distributed perspective but not the later the integrative perspective since the Internet lacks inherent technical controls for surveillance and content control which are necessary in a world order where borders are important Regardless of if that importance stems from state oversight or intellectual property rights legislation I use these perspectives together with technology markets and bureaucracy to catch the dynamics of the Internet ecology I then compare these dynamics with other technological and societal phenomena such as railway networks postal services and financial markets And conclude that the Internet as conceptualized in this thesis can best be explained by technological values in opposite to the other examples which can best by explained by the dynamics of markets and bureaucracies without any real influence of the values of

technology As such I suggest that the classical frame of markets and bureaucracy can fruitfully be expanded with technology to better explain the Internet and similar digitization phenomena This thesis puts current trends in a broader perspective based on technology and organization where the two perspectives together better can draw the full picture in a rich fashion
