Machine Learners Adrian Mackenzie, 2017-11-16 If machine learning transforms the nature of knowledge does it also transform the practice of critical thought Machine learning programming computers to learn from data has spread across scientific disciplines media entertainment and government Medical research autonomous vehicles credit transaction processing computer gaming recommendation systems finance surveillance and robotics use machine learning Machine learning devices sometimes understood as scientific models sometimes as operational algorithms anchor the field of data science They have also become mundane mechanisms deeply embedded in a variety of systems and gadgets In contexts from the everyday to the esoteric machine learning is said to transform the nature of knowledge In this book Adrian Mackenzie investigates whether machine learning also transforms the practice of critical thinking Mackenzie focuses on machine learners either humans and machines or human machine relations situated among settings data and devices The settings range from fMRI to Facebook the data anything from cat images to DNA sequences the devices include neural networks support vector machines and decision trees He examines specific learning algorithms writing code and writing about code and develops an archaeology of operations that following Foucault views machine learning as a form of knowledge production and a strategy of power Exploring layers of abstraction data infrastructures coding practices diagrams mathematical formalisms and the social organization of machine learning Mackenzie traces the mostly invisible architecture of one of the central zones of contemporary technological cultures Mackenzie's account of machine learning locates places in which a sense of agency can take root His archaeology of the operational formation of machine learning does not unearth the footprint of a strategic monolith but reveals the local tributaries of force that feed into the generalization and plurality of the field

Improving Bayesian Reasoning: What

Works and Why? Gorka Navarrete,David R. Mandel,2016-02-02 We confess that the first part of our title is somewhat of a misnomer Bayesian reasoning is a normative approach to probabilistic belief revision and as such it is in need of no improvement Rather it is the typical individual whose reasoning and judgments often fall short of the Bayesian ideal who is the focus of improvement What have we learnt from over a half century of research and theory on this topic that could explain why people are often non Bayesian Can Bayesian reasoning be facilitated and if so why These are the questions that motivate this *Frontiers in Psychology Research Topic* Bayes theorem named after English statistician philosopher and Presbyterian minister Thomas Bayes offers a method for updating one s prior probability of an hypothesis H on the basis of new data D such that $P(H|D) = \frac{P(D|H)P(H)}{P(D)}$ The first wave of psychological research pioneered by Ward Edwards revealed that people were overly conservative in updating their posterior probabilities i e $P(H|D) < \frac{P(D|H)P(H)}{P(D)}$ A second wave spearheaded by Daniel Kahneman and Amos Tversky showed that people often ignored prior probabilities or base rates where the priors had a frequentist interpretation and hence were not Bayesians at all In the 1990s a third wave of research spurred by Leda Cosmides and John Tooby and by Gerd Gigerenzer and Ulrich Hoffrage showed that people can reason more like a Bayesian if only the information provided takes the form of non relativized natural frequencies Although Kahneman and Tversky had already noted the advantages of frequency representations it was the third wave scholars who pushed the prescriptive agenda arguing that there are feasible and effective methods for improving belief revision Most scholars now agree that natural frequency representations do facilitate Bayesian reasoning However they do not agree on why this is so The original third wave scholars favor an evolutionary account that posits human brain adaptation to natural frequency processing But almost as soon as this view was proposed other scholars challenged it arguing that such evolutionary assumptions were not needed The dominant opposing view has been that the benefit of natural frequencies is mainly due to the fact that such representations make the nested set relations perfectly transparent Thus people can more easily see what information they need to focus on and how to simply combine it This *Research Topic* aims to take stock of where we are at present Are we in a proto fourth wave If so does it offer a synthesis of recent theoretical disagreements The second part of the title orients the reader to the two main subtopics what works and why In terms of the first subtopic we seek contributions that advance understanding of how to improve people s abilities to revise their beliefs and to integrate probabilistic information effectively The second subtopic centers on explaining why methods that improve non Bayesian reasoning work as well as they do In addressing that issue we welcome both critical analyses of existing theories as well as fresh perspectives For both subtopics we welcome the full range of manuscript types
