Clock Synchronization in Distributed Systems - a Comparison Harald Bachner, 2007-07-26 Bachelor Thesis from the year 2007 in the subject Computer Science Technical Computer Science grade 1 0 University of Applied Sciences Technikum Vienna Informations und Kommunikationssysteme 29 entries in the bibliography language English abstract Clock synchronization is a necessary and critical part in most distributed systems For many years NTP was the state of the art way of synchronizing computer clocks distributed in space However as recent advances in miniaturization lead to the construction of smaller more powerful and less power consuming computers embedded devices sensors and actuators the need for more precise time synchronization grew This work thus sets out to compare selected approaches to clock synchronization in distributed systems The well known Global Positioning System is disseminating accurate time and frequency information from the International Institutes that keep the time NTP can still do the same but at different levels of accuracy as well as cost Clock synchronization protocols like IEEE1588 or TTP and bus architectures like FlexRay evolved from the need to further propagate the timing information within small networks and therefore staying within the specified limits of preciseness

virtualization and the various techniques involved in it as well as a short historical overview about when the first types of virtualization were introduced and why they failed since according to A Tanenbaum the current hardware is not made to be virtualized The findings will mostly be supported by examples of current virtual environments especially the XEN project The paper will first introduce the different ways of virtualizing a system and in how far hardware can or can not support this The second part will introduce the current software for virtualizing a server and giving users their own separated environment starting from early approaches like BSD jails to the Linux V Server and XEN Project The last chapter will cover the use of server virtualization in high availability environments With the use of n physical machines and m virtualized systems on each machine an environment of n m x can be created where x is the level of redundancy e g x 2 for mirroring Most interesting is how virtual environments can be moved from one physical machine to another one without switching it off The summary will give some insight on the current use of virtual environments and in how far they provide advantages over solutions like Mosix Application basic virtualization and the grid It will also give an outlook on further developments especially in the field of hardware support for virtualization
