positive view of misconceptions suggests respectful language like alternative frameworks for children's thinking and concept formation. The most important consideration is to provide children with the conditions including time to articulate their reasoning, confront alternatives, and make a rational decision to change their mind or not. This book makes use of recent and extensive original data from the authors' own researches on children's performance, errors, and misconceptions across the mathematics curriculum, including standardised data from a large national sample of 4 to 15 year olds and conversations involving children in argumentation and work with teachers implementing change in their classrooms. The cycle of research includes use of written diagnostic test items, children's reasoning as captured in group argumentation, details of the types of reasoning that help children to change their mind, and the development of tools for classroom teaching by practising teachers. The discussion of research is anchored in practical learning and teaching contexts in order to directly relate to mathematics teaching practice and teachers' expertise. The book progressively develops concepts for teachers to use in organising their understanding and knowledge of children's mathematics, concluding with an introduction to theoretical accounts of learning and teaching that can help make practical sense. The book bridges the gap between research in the psychology of learning mathematics and the reality of classroom practice. The book is ground breaking in that it transforms research on diagnostic errors, argumentation, and teaching strategies into knowledge for teaching. The voices in the research include those of children and teachers in classrooms as well as the academic and research communities.
