stroke process with engine speed of 4000 rpm The intake port of the engine was modified to vary the intake timing The modification of intake port was done by using Computer Aided Design CAD software Solidwork From the CFD analysis the in cylinder air flow pattern and flow distribution before and after intake port modification was clarified Simulation result shows that as the diameter of the port is decreased the pressure drop and velocity of air flow into the engine cylinder are increased Modification of the intake port shape from curved port to straight port was result in more symmetrical in cylinder air flow distribution along the cylinder axis For further study it is strongly recommended to verify the simulation result with the experiment result as soon as the engine was successfully fabricated
