Advances in Mathematical Economics is a publication of the Research Center for Mathematical Economics which was founded in 1997 as an international scientific association that aims to promote research activities in mathematical economics Our publication was launched to realize our long term goal of bringing together those mathematicians who are seriously interested in obtaining new challenging stimuli from economic theories and those economists who are seeking effective mathematical tools for their research The scope of Advances in Mathematical Economics includes but is not limited to the following fields economic theories in various fields based on rigorous mathematical reasoning mathematical methods e g analysis algebra geometry probability motivated by economic theories mathematical results of potential relevance to economic theory historical study of mathematical economics Authors are asked to develop their original results as fully as possible and also to give a clear cut expository overview of the problem under discussion Consequently we will also invite articles which might be considered too long for publication in journals

Mathematical Economics G. Hammer, Diethard Pallaschke, 2012-12-06 Let $e^{\mathbb{R}N}$ be the usual vector space of real N tuples with the usual inner product denoted by $\langle \cdot, \cdot \rangle$. In this paper P is a nonempty compact polyhedral set of mN f is a real valued function defined on \mathbb{R}^N continuously differentiable and $f|_P$ is the linearly constrained minimization problem stated as $\min_{x \in P} f(x)$. For computing stationary points of $f|_P$ we propose a method which attempts to operate within the linear simplex method structure. This method then appears as a same type of method as the convex simplex method of Zangwill [6]. It is however different and has the advantage of being less technical with regards to the Zangwill method. It has also a simple geometrical interpretation which makes it more understandable and more open to other improvements. Also in the case where f is convex an implementable line search is proposed which is not the case in the Zangwill method. Moreover if $f(x) = c \cdot x$ this method will coincide with the simplex method, this is also true in the case of the convex simplex method if $f(x) = |x|$ it will be almost the same as the algorithm given by Bazaraa, Goode and Rardin [2].
