Deep Energy Retrofit Alexander Zhivov, Rüdiger Lohse, 2020-07-13 This book provides detailed information on how to set up Deep Energy Retrofits DERs in public buildings and shares in depth insights into the current status of the major technologies strategies and best practice examples of how to cost effectively combine them Case studies from the U S A and Europe show that that Deep Energy Retrofit can be achieved with a limited core technologies bundle readily available on the market Characteristics of some of these core technology measures depend on the technologies available on an individual nation s market on the minimum requirements of national standards and on economics as determined by a life cycle cost analysis Also requirements to building envelope related technologies e g insulation levels windows vapor and water barriers and requirements for building airtightness depend on specific climate conditions This Guide provides best practice examples of how to apply these technologies in different construction situations High levels of energy use reduction using core technology bundles along with improvements in indoor climate and thermal comfort can be only achieved when a Deep Energy Retrofit adopts a quality assurance process In addition to design construction commissioning and post occupancy

phases of the quality assurance process the Guide emphasizes the importance of clearly and concisely formulating and documenting the Owner's goals, expectations and requirements for the renovated building during development of the statement of work. Another important component of the quality assurance process is a procurement phase during which bidders' qualifications, their understanding of the scope of work and its requirements and their previous experience are analyzed. The building sector holds the potential for tremendous improvements in terms of energy efficiency and reducing carbon emissions and energy retrofits to the existing building stock represent a significant opportunity in the transition to a low carbon future. Moreover, investing in highly efficient building materials and systems can replace long term energy imports, contribute to cost cutting and create a wealth of new jobs. Yet while the technologies needed in order to improve energy efficiency are readily available, significant progress has not yet been made and best practices for implementing building technologies and renewable energy sources are still relegated to small niche applications. Offering essential information on Deep Energy Retrofits, the book offers a valuable asset for architects, public authorities, project developers and engineers alike.
