Klein, 2011-08-18 Have you ever wanted to know how modern digital communications systems work Find out with this step by step guide to building a complete digital radio that includes every element of a typical real world communication system Chapter by chapter you will create a MATLAB realization of the various pieces of the system exploring the key ideas along the way as well as analyzing and assessing the performance of each component Then in the final chapters you will discover how all the parts fit together and interact as you build the complete receiver In addition to coverage of crucial issues such as timing carrier recovery and equalization the text contains over 400 practical exercises providing invaluable preparation for industry where wireless communications and software radio are becoming increasingly important A variety of extra resources are also provided online including lecture slides and a solutions manual for instructors

Real-Time Digital Signal Processing Sen M. Kuo, Bob H. Lee, Wenshun Tian, 2013-08-05 Combines both the DSP principles and real time implementations and applications and now updated with the new eZdsp USB Stick which is very low cost portable and widely employed at many DSP labs Real Time Digital Signal Processing introduces fundamental digital signal processing DSP principles and will be updated to include the latest DSP applications introduce new software development tools and adjust the software design process to reflect the latest advances in the field In the 3rd edition of the book the key aspect of hands on experiments will be enhanced to make the DSP principles more interesting and directly interact with the real world applications All of the programs will be carefully updated using the most recent version of software development tools and the new TMS320VC5505 eZdsp USB Stick for real time experiments Due to its lower cost and portability the new software and hardware tools are now widely used in university labs and in commercial industrial companies to replace the older and more expensive generation The new edition will have a renewed focus on real time applications and will offer step by step hands on experiments for a complete design cycle starting from floating point C language program to fixed point C implementation code optimization using INTRINSICS and mixed C and assembly programming on fixed point DSP processors This new methodology enables readers to concentrate on learning DSP fundamentals and innovative applications by relaxing the intensive programming efforts namely the traditional DSP

assembly coding efforts The book is organized into two parts Part One introduces the digital signal processing principles and theories and Part Two focuses on practical applications The topics for the applications are the extensions of the theories in Part One with an emphasis placed on the hands on experiments systematic design and implementation approaches The applications provided in the book are carefully chosen to reflect current advances of DSP that are of most relevance for the intended readership Combines both the DSP principles and real time implementations and applications using the new eZdsp USB Stick which is very low cost portable and widely employed at many DSP labs is now used in the new edition Places renewed emphasis on C code experiments and reduces the exercises using assembly coding effective use of C programming fixed point C code and INTRINSICS will become the main focus of the new edition Updates to application areas to reflect latest advances such as speech coding techniques used for next generation networks NGN audio coding with surrounding sound wideband speech codec ITU G 722 2 Standard fingerprint for image processing and biomedical signal processing examples Contains new addition of several projects that can be used as semester projects as well as new many new real time experiments using TI s binary libraries the experiments are prepared with flexible interface and modular for readers to adapt and modify to create other useful applications from the provided basic programs Consists of more MATLAB experiments such as filter design algorithm evaluation proto typing for C code architecture and simulations to aid readers to learn DSP fundamentals Includes supplementary material of program and data files for examples applications and experiments hosted on a companion website A valuable resource for Postgraduate students enrolled on DSP courses focused on DSP implementation engineers and programmers who need to learn and use DSP principles and development tools for their projects

Adaptive Equalization Adnan Raza,1996 Machine Learning Sergios Theodoridis,2015-04-02 This tutorial text gives a unifying perspective on machine learning by covering both probabilistic and deterministic approaches which are based on optimization techniques together with the Bayesian inference approach whose essence lies in the use of a hierarchy of probabilistic models The book presents the major machine learning methods as they have been developed in different disciplines such as statistics statistical and adaptive signal processing and computer science Focusing on the physical reasoning behind the mathematics all the various methods and techniques are explained in depth supported by examples and problems giving an invaluable resource to the student and researcher for understanding and applying machine learning concepts The book builds carefully from the basic classical methods to the most recent trends with chapters written to be as self contained as possible making the text suitable for different courses pattern recognition statistical adaptive signal processing statistical Bayesian learning as well as short courses on sparse modeling deep learning and probabilistic graphical models All major classical techniques Mean Least Squares regression and filtering Kalman filtering stochastic approximation and online learning Bayesian classification decision trees logistic regression and boosting methods The latest trends Sparsity convex analysis and optimization online distributed algorithms learning in RKH spaces Bayesian inference

An Introduction to Digital Communications Jack Kurzweil, 2000 The only book available that integrates a realistic design approach with a theoretical approach This outstanding new book focuses on the central theoretical and practical issues involved in modem design The first half deals with the basic issues of base band and passband data transmission and contains descriptions of applications to specific digital transmission systems The second half specifically addresses design issues including timing and carrier recovery channel characterization adaptive equalization and trellis coding The author uses simulation programs in Matlab and C to help readers Determine the power spectral density of complex data encoding rules Simulate the performance of passband data transmission techniques Design and assess the performance of carrier recovery systems Develop time domain models for a variety of channels Design and assess the performance of adaptive equalizers Use existing programs as the framework for creating simulation modules

Getting Started with Signal Processing Blockset 6, 2007 [Theory and Design of Adaptive Filters](#) John R. Treichler, C. Richard Johnson, Michael G. Larimore, 2001 Rather than superficially examining an extensive list of possible applications benefiting from adaptive filter use the authors examine four such problems in detail and review the common attributes that are shared with many other applications of adaptive filtering The authors develop the basic rules and algorithms for filter performance and provide tools for design along with an appreciation of the complexity of behavioral analysis Derivations and convergence discussions are kept to a basic level The presentation focuses on a few principles and applies them to a series of motivating examples that include in depth discussion of implementation aspects for filter design not found in other books Serves as a valuable reference for practicing engineers
