Nonlinear Control and Filtering Using Differential Flatness Approaches Gerasimos G. Rigatos, 2016-10-13 This monograph presents recent advances in differential flatness theory and analyzes its use for nonlinear control and estimation It shows how differential flatness theory can provide solutions to complicated control problems such as those appearing in highly nonlinear multivariable systems and distributed parameter systems Furthermore it shows that differential flatness theory makes it possible to perform filtering and state estimation for a wide class of nonlinear dynamical systems and provides several descriptive test cases The book focuses on the design of nonlinear adaptive controllers and nonlinear filters using exact linearization based on differential flatness theory The adaptive controllers obtained can be applied to a wide class of nonlinear systems with unknown dynamics and assure reliable functioning of the control loop under uncertainty and varying operating conditions The filters obtained outperform other nonlinear filters in terms of accuracy of estimation and computation speed The book presents a series of application examples to confirm the efficiency of the proposed nonlinear filtering and adaptive control schemes for various electromechanical systems These include industrial robots mobile robots and autonomous vehicles electric power generation electric motors and actuators power electronics internal combustion engines distributed parameter systems and communication systems Differential Flatness Approaches to Nonlinear Control and Filtering will be a useful reference for academic researchers studying advanced problems in nonlinear control and nonlinear dynamics and for engineers working on control applications in electromechanical systems

Towards Constructive Nonlinear Control Systems Analysis and Design Mario Sassano, David Angeli, Alessandro Astolfi, 2012 This work presents a novel method to solve analysis and design problems for nonlinear control systems the classical solutions of which rely on the solvability or on the solution itself of partial differential equations or inequalities The first part of the thesis is dedicated to the analysis of nonlinear systems The notion of Dynamic Lyapunov function is introduced These functions allow to study stability properties of equilibrium points similarly to standard Lyapunov functions In the former however a positive definite function is combined with a dynamical system that render Dynamic Lyapunov functions easier to construct than Lyapunov functions These ideas are then

extended to characterize Dynamic Controllability and Observability functions which are exploited in the model reduction problem for nonlinear systems Constructive solutions to the L2 disturbance attenuation and the optimal control problems are proposed in the second part of the thesis The key aspect of these solutions is the definition of Dynamic Value functions that generalizing Dynamic Lyapunov functions consist of a dynamical feedback and a positive definite function In the last part of the thesis a similar approach is utilized to simplify the observer design problem via the Immersion and Invariance technique Finally the effectiveness of the methodologies is illustrated by means of several applications including range estimation and the optimal robust control of mechanical systems combustion engine test benches and the air path of a diesel engine

Nonlinear Systems A.J. Fossard,D. Normand-Cyrot,1996-07-31 *Nonlinear Systems* is divided into three volumes The first deals with modeling and estimation the second with stability and stabilization and the third with control This three volume set provides the most comprehensive and detailed reference available on nonlinear systems Written by a group of leading experts in the field drawn from industry government and academic institutions it provides a solid theoretical basis on nonlinear control methods as well as practical examples and advice for engineers teachers and researchers working with nonlinear systems Each book focuses on the applicability of the concepts introduced and keeps the level of mathematics to a minimum Simulations and industrial examples drawn from aerospace as well as mechanical electrical and chemical engineering are given throughout

Nonlinear Industrial Control Systems Michael J. Grimble,Paweł Majecki,2020-05-19 *Nonlinear Industrial Control Systems* presents a range of mostly optimisation based methods for severely nonlinear systems it discusses feedforward and feedback control and tracking control systems design The plant models and design algorithms are provided in a MATLAB toolbox that enable both academic examples and industrial application studies to be repeated and evaluated taking into account practical application and implementation problems The text makes nonlinear control theory accessible to readers having only a background in linear systems and concentrates on real applications of nonlinear control It covers different ways of modelling nonlinear systems including state space polynomial based linear parameter varying state dependent and hybrid design techniques for nonlinear optimal control including generalised minimum variance model predictive control quadratic Gaussian factorised and H design methods design philosophies that are suitable for aerospace automotive marine process control energy systems robotics servo systems and manufacturing steps in design procedures that are illustrated in design studies to define cost functions and cope with problems such as disturbance rejection uncertainties and integral wind up and baseline non optimal control techniques such as nonlinear Smith predictors feedback linearization sliding mode control and nonlinear PID *Nonlinear Industrial Control Systems* is valuable to engineers in industry dealing with actual nonlinear systems It provides students with a comprehensive range of techniques and examples for solving real nonlinear control design problems

Data-driven Nonlinear Control Designs for Constrained Systems Roland Harvey,2020 Systems with nonlinear dynamics are theoretically constrained to the realm of nonlinear analysis and design while explicit constraints are expressed as equalities or inequalities of state input and output vectors of differential equations Few control designs exist for systems with such explicit constraints and no generalized solution has been provided This dissertation presents general techniques to design stabilizing controls for a specific class of nonlinear systems with constraints on input and output and verifies that such designs are straightforward to implement in selected applications Additionally a closed form technique for an open loop problem with unsolvable dynamic equations is developed Typical optimal control methods cannot be readily applied to nonlinear systems without heavy modification However by embedding a novel control framework based on barrier functions and feedback linearization well established optimal control techniques become applicable when constraints are imposed by the design in real time Applications in power systems and aircraft control often have safety performance and hardware restrictions that are combinations of input and output constraints while cryogenic memory applications have design

restrictions and unknown analytic solutions Most applications fall into a broad class of systems known as passivity short in which certain properties are utilized to form a structural framework for system interconnection with existing general stabilizing control techniques Previous theoretical contributions are extended to include constraints which can be readily applied to the development of scalable system networks in practical systems even in the presence of unknown dynamics In cases such as these model identification techniques are used to obtain estimated system models which are guaranteed to be at least passivity short With numerous analytic tools accessible a data driven nonlinear control design framework is developed using model identification resulting in passivity short systems which handles input and output saturations Simulations are presented that prove to effectively control and stabilize example practical systems
