**Coastal and Shelf Sea Modelling** Philip P. G. Dyke, 2013-04-17 Since the computing revolution modelling has become the most important way in which we further our knowledge about how the sea moves and how the processes in the sea operate The coast and the continental shelf are two of the most important areas of the sea to understand Coastal and Shelf Sea Modelling is therefore very timely and important In this text modelling the processes that occur in the sea is motivated continually through real life examples Sometimes these are incorporated naturally within the text but there are also a number of case studies taken from the recent research literature These will be particularly valuable to students as they are presented in a style more readily accessible than that found in a typical research journal The motivation for modelling is care for the environment The well publicised problem of global warming the phenomenon of El Ni o more localised pollution scares caused by tanker accidents and even smaller scale coastal erosion caused by storms all provide motivation for modelling and all get coverage in this text Particularly novel features of the book include a systematic treatment of the modelling process in a marine context the inclusion of diffusion in some detail ecosystems modelling and a brief foray into wave prediction The final chapter provides the reader with the opportunity to do some modelling there are many worked examples followed by exercises that readers can try themselves All answers are provided Throughout the style is informal and the technicalities in term of mathematics are kept to a minimum Coastal and Shelf Sea Modelling is particularly suitable for graduate marine and oceanographic modelling courses but will also prove useful to coastal engineers and students at any level interested in the quantitative modelling of marine processes It is stressed that only a minimal level of mathematics first year calculus or less is required the style and content is introductory
