Acquisition of Active Multichannel Analysis of Surface Waves (MASW) Data in Karst Terrain Ghassan Salem Alsulaimani, 2017 This study was designed to verify the effects and data reproducibility when the length of receiver array receiver spacing source offset and array orientation parameters are changed for data acquired using multichannel analysis of surface waves MASW at intended target depth of 30ft 9m and to compare the results with electrical resistivity tomography ERT data obtained for the same study site The MASW data acquired for 34 sites along four profiles for each site using variable source offsets of 10ft 3m and 30ft 9 1m and variable receiver spacings of 2 5ft 0 76m and 5 0ft 0 76m concurrently Out of the 272 profiles studied 136 profiles were oriented east west and 136 profiles were oriented north south The MASW data was used in conjunction with ERT data to ensure the accuracy of the ERT data The comparative analysis indicated the profile configuration measurements have significant influence on the quality of the data and that the best

inversion analysis is obtained when the dispersion curves are created using the north south oriented arrays The MASW survey study concluded that the most consistent and beneficial karst terrain dispersion images were those obtained from the predicted optimal acquisition using receiver spacing dx 2 5ft source offset X1 10ft and depth of investigation of about 30ft Abstract page iii *The Leading Edge* ,2008 *Annual Meeting* Association of Environmental & Engineering Geologists,2006 **Near Surface 2004** ,2004 Geotechnical and Geophysical Site Characterization António Viana da Fonseca,Paul W.
