Gender and food loss in sustainable fish value chains in Africa Randrianantoandro, A., Ward, W., Safa Barraza, A., 2022-03-17 Food losses are a major concern and occur in most fish distribution chains worldwide Not only do losses constitute lost income to fishers processors and traders but they also contribute to food insecurity Progress has been made in identifying the direct causes of fish losses and quantifying the magnitude of the loss However loss reduction strategies have

tended to focus on technological solutions and hence have overlooked the relevance of socio economic factors including gender relations that influence the functioning of the fisheries value chain This document provides guidance on integrating gender concerns into food loss interventions within the fish value chains It describes the different steps to understand the key components of a gender sensitive food loss value chain analysis In particular it recommends highlighting the dynamics and factors that influence women s and men s natural social disposition and participation in fisheries activities according to dominant assigned gender roles While addressing the existing knowledge gaps and contributing to the development of an approach tailored to African small scale fish value chains this document also provides introductory information on the application of the FAO Gender Responsive Fish Loss Assessment Methodology GRFLAM Synchronous data acquisition with wireless sensor networks Funck, Jürgen Helmut, 2018-07-19 Wireless sensor networks WSN are predicted to play a key role in future technological developments like the internet of things Already they are beginning to be used in many applications not only in the scientific and industrial domains One of the biggest challenges when using WSN is to fuse and evaluate data from different sensor nodes Synchronizing the data acquisition of the nodes is a key enabling factor for this So far research has been focused on synchronizing the clocks of the nodes largely neglecting the implications for the actual measurement results This thesis investigates the relation between synchronization accuracy and quality of measurement results Two different classes of time synchronous data acquisition are investigated event detection and waveform sampling A model is developed that describes a WSN as a generic multi channel data acquisition system thus enabling direct comparison to other existing systems With the help of this model it is shown that synchronization accuracy should best be expressed as uncertainty of the acquired timing information This way not only the contribution of the synchronization to the overall measurement uncertainty can be assessed but also the synchronization accuracy required for an application can be estimated The insights from the uncertainty analysis are used to develop two distinct approaches to synchronous data acquisition a proactive and a reactive one It is shown that the reactive approach can also be used to efficiently implement synchronous angular sampling i e data acquisition synchronous to the rotation of a machine s shaft Furthermore testing methods are suggested that evaluate the synchronized data acquisition of an existing WSN as a whole These methods can be applied to other data acquisition systems without changes thus enabling direct comparisons The practical realization of a WSN is described on which the developed data acquisition methods have been implemented All implementations were thoroughly tested in experiments using the suggested testing methods This way it was revealed that a system s interrupt handling procedures may have a strong influence on the data acquisition Furthermore it was shown that the effective use of fixed point arithmetic enables synchronous angular sampling in real time during a streaming measurement Finally two application examples are used to illustrate the utility of the implemented data acquisition the acoustic localization of two sensor nodes on a straight line and a simple order tracking at an induction motor test bench Diese Dissertation untersucht die Zusammenh

nge zwischen Synchronisationsgenauigkeit und Qualität der Messergebnisse Zwei Klassen von zeitsynchroner Datenerfassung werden dabei betrachtet die Detektion von Ereignissen und die Aufnahme von Kurvenformen Es wird ein Modell entwickelt welches ein WSN als ein allgemeines mehrkanaliges Datenerfassungssystem beschreibt Dies ermöglicht den direkten Vergleich zwischen WSN und anderen Messsystemen Weiter wird mit Hilfe des Modells gezeigt dass die Synchronisationsgenauigkeit vorzugsweise als Unsicherheit der Zeitinformation angegeben werden sollte Hierdurch kann nicht nur der Beitrag der Synchronisation zur gesamten Messunsicherheit bestimmt sondern auch die von einer Anwendung tatsächlich benötigte Synchronisationsgenauigkeit abgeschätzt werden Ausgehend von den durch die Unsicherheitsbetrachtung gewonnenen Erkenntnissen werden ein proaktiver und ein reaktiver Ansatz zur synchronen Datenaufnahme entwickelt Mit dem reaktiven Ansatz können Messdaten auch effizient drehwinkelsynchron und synchron zur Drehbewegung einer Maschinenwelle aufgenommen werden Es werden Testverfahren vorgeschlagen mit denen sich die Synchronizität der Datenerfassung für ein WSN als Ganzes überprüfen lässt Diese Verfahren lassen sich unverändert auf andere Messsysteme anwenden und ermöglichen somit direkte Vergleiche Es wird die praktische Umsetzung eines WSN beschrieben auf dem die entwickelten Methoden zur Datenerfassung implementiert wurden Alle Implementierungen wurden mit den vorgeschlagenen Testverfahren untersucht Hierdurch konnte gezeigt werden dass die Interrupt-Bearbeitung der Sensorknoten entscheidenden Einfluss auf die Messdatenerfassung hat Weiter konnte durch den Einsatz von Fixed-Point-Arithmetik die drehwinkelsynchrone Datenerfassung in Echtzeit realisiert werden Schließlich wird die Nutzlichkeit der implementierten Datenerfassung an zwei Anwendungen gezeigt der akustischen Ortung zweier Sensorknoten sowie einer einfachen Ordnungsanalyse

Leaving no one behind Food and Agriculture Organization of the United Nations ,2020-10-13 In Africa women are critical agents of change in the fight against rural poverty hunger and malnutrition They are the backbone of their households communities and rural economies covering important roles in food production processing and marketing and also in the nutrition of the family However with food systems rapidly modernizing and dramatic effects of climate change and environmental degradation becoming the new normal they continue to face multiple challenges due to persisting gender discriminations Over the years remarkable political commitments to improve women s condition and status have been made but substantial gender gaps still remain in the access and control over productive resources and assets services and markets Overcoming these challenges will require addressing the root causes of gender inequalities through innovative and gender transformative approaches According to FAO s latest estimates SOFI 2019 the number of people suffering from hunger has been rising Just this trend and the awareness that we lost a decade of progress is sufficient to underscore the immense challenge of achieving the Zero Hunger target by 2030 The situation is most alarming in sub Saharan Africa where the number of undernourished people has steadily increased since 2014 to 237 million in 2018 These findings are in line with the 2019 SDG report It shows that we are still lagging behind in achieving the SDGs as the global response has not been ambitious enough Space and Geospatial Technologies for the Africa We Want Jossam Potel, Kamal Labbassi, Solomon

35 Gbps FPGA-based Network Processor Rui Pang, University of Texas at Dallas. Graduate Program in Electrical Engineering, 2012 With the need for packet processing in high throughput networks and the higher expense for high performance network processor low cost programmable Network Processors on FPGAs are gaining attention We utilize a hash function small size parallel CAMs and an external RAM to implement a high performance 35 Gbps network processor to handle 524 288 flows FPGAs are chosen to realize reconfigurable network processors for executing field upgrade In this thesis a hash function is proposed and implemented to analyze and route incoming packets to specific CAM architectures at high speed with low overhead To match incoming packets with pre stored flows a parallel structure of CAMs is proposed to meet the high speed requirements In order to provide a low cost and low power consuming solution an external RAM is used instead of large size expensive CAMs to store a large amount of information on flows at a fraction of the cost compared to the CAM

Workload-aware Network Processors Muhammad Faisal Iqbal, 2013 Network Processors are multicore processors capable of processing network packets at wire speeds of multi Gbps Due to their high performance and programmability these processors have become the

main computing elements in many demanding network processing equipments like enterprise edge and core routers. With the ever increasing use of the internet the processing demands of these routers have also increased. As a result the number and complexity of the cores in network processors have also increased. Hence efficiently managing these cores has become very challenging. This dissertation discusses two main issues related to efficient usage of large number of parallel cores in network processors: 1. How to allocate work to the processing cores to optimize performance. 2. How to meet the desired performance requirement power efficiently. This dissertation presents the design of a hash based scheduler to distribute packets to cores. The scheduler exploits multiple dimensions of locality to improve performance while minimizing out of order delivery of packets. This scheduler is designed to work seamlessly when the number of cores allocated to a service is changed. The design of a resource allocator is also presented which allocates different number of cores to services with changing traffic behavior. To improve the power efficiency a traffic aware power management scheme is presented which exploits variations in traffic rates to save power. The results of simulation studies are presented to evaluate the proposals using real and synthetic network traces. These experiments show that the proposed packet scheduler can improve performance by as much as 40% by improving locality. It is also observed that traffic variations can be exploited to save significant power by turning off the unused cores or by running them at lower frequencies. Improving performance of the individual cores by careful scheduling also helps to reduce the power consumption because the same amount of work can now be done with fewer cores with improved performance. The proposals made in this dissertation show promising improvements over the previous work. Hashing based schedulers have very low overhead and are very suitable for data rates of 100 Gbps and even beyond.

Design and Implementation of a High Performance Network Processor with Dynamic Workload Management

Padmaja Duggisetty, 2015. Internet plays a crucial part in today's world. Be it personal communication, business transactions or social networking, internet is used everywhere and hence the speed of the communication infrastructure plays an important role. As the number of users increase the network usage increases, i.e. the network data rates ramped up from a few Mb/s to Gb/s in less than a decade. Hence the network infrastructure needed a major upgrade to be able to support such high data rates. Technological advancements have enabled the communication links like optical fibres to support these high bandwidths but the processing speed at the nodes remained constant. This created a need for specialised devices for packet processing in order to match the increasing line rates which led to emergence of network processors. Network processors were both programmable and flexible. To support the growing number of internet applications a single core network processor has transformed into a multi many core network processor with multiple cores on a single chip rather than just one core. This improved the packet processing speeds and hence the performance of a network node. Multi core network processors catered to the needs of a high bandwidth networks by exploiting the inherent packet level parallelism in a network. But these processors still had intrinsic challenges like load balancing. In order to maximise throughput of these multi

core network processors it is important to distribute the traffic evenly across all the cores This thesis describes a multi core network processor with dynamic workload management A multi core network processor which performs multiple applications is designed to act as a test bed for an effective workload management algorithm An effective workload management algorithm is designed in order to distribute the workload evenly across all the available cores and hence maximise the performance of the network processor Runtime statistics of all the cores were collected and updated at run time to aid in deciding the application to be performed on a core to to enable even distribution of workload among the cores Hence when an overloading of a core is detected the applications to be performed on the cores are re assigned For testing purposes we built a flexible and a reusable platform on NetFPGA 10G board which uses a FPGA based approach to prototyping network devices The performance of the designed workload management algorithm is tested by measuring the throughput of the system for varying workloads
