Numerical Modelling of Material Deformation

Processes Peter Hartley, Ian Pillinger, Clive E.N. Sturgess, 2012-12-06 The principal aim of this text is to encourage the development and application of numerical modelling techniques as an aid to achieving greater efficiency and optimization of metal forming processes The contents of this book have therefore been carefully planned to provide both an introduction to the fundamental theory of material deformation simulation and also a comprehensive survey of the state of the art of deformation modelling techniques and their application to specific and industrially relevant processes To this end leading international figures in the field of material deformation research have been invited to contribute chapters on subjects on which they are acknowledged experts The information in this book has been arranged in four parts Part I deals with plasticity theory Part II with various numerical modelling techniques Part III with specific process applications and material phenomena and Part IV with integrated computer systems The objective of Part I is to establish the underlying theory of material deformation on which the following chapters can build It begins with a chapter which reviews the basic theories of classical plasticity and describes their analytical representations The second chapter moves on to look at the theory of deforming materials and shows how these expressions may be used in numerical techniques The last two chapters of Part I provide a review of isotropic plasticity and anisotropic plasticity

Computer Applications for Modeling, Simulation, and Automobile

Handbook of Fabrication Processes Orville D. Lascoe, 1988-01-01 This book is a valuable reference for the materials engineer the manufacturing engineer or the technician who wants a practical description of fabrication processes Sheet metal fabrication processes are receiving greater attention and are more widely applied by the metalworking industries because of the savings in cost and material This book compiles the proven theories and operations tested in industrial applications Focus is on the non chip producing machine tools that shape metals by shearing pressing and forming New materials and advances in tooling are discussed as well as the need for applied science in optimizing the operations for sheet metal fabrication processes Examples of each of these forming processes are given and the text also describes the mechanics of each process so that a logical decision can be made concerning the best operation for a specific result The volume is divided into five sections each consisting of a series of chapters The major sections cover fabricating presses stamping and forming operations plastics for tooling structural shapes and non traditional machining A section on definitions and terminology is also included The book is profusely illustrated and indexed making it easy to find references to specific
