Programming for Hybrid Multi/Manycore MPP Systems John Levesque, Aaron Vose, 2017-10-10 Ask not what your compiler can do for you ask what you can do for your compiler John Levesque Director of Cray's Supercomputing Centers of Excellence The next decade of computationally intense computing lies with more powerful multi manycore nodes where processors share a large memory space These nodes will be the building block for systems that range from a single node workstation up to systems approaching the exaflop regime The node itself will consist of 10 s to 100 s of MIMD multiple instruction multiple data processing units with SIMD single instruction multiple data parallel instructions Since a standard affordable memory architecture will not be able to supply the bandwidth required by these cores new memory organizations will be introduced These new node architectures will represent a significant challenge to application developers

Programming for Hybrid Multi Manycore MPP Systems attempts to briefly describe the current state of the art in programming these systems and proposes an approach for developing a performance portable application that can effectively utilize all of these systems from a single application The book starts with a strategy for optimizing an application for multi manycore architectures It then looks at the three typical architectures covering their advantages and disadvantages The next section of the book explores the other important component of the target the compiler The compiler will ultimately convert the input language to executable code on the target and the book explores how to make the compiler do what we want The book then talks about gathering runtime statistics from running the application on the important problem sets previously discussed How best to utilize available memory bandwidth and virtualization is covered next along with hybridization of a program The last part of the book includes several major applications and examines future hardware advancements and how the application developer may prepare for those advancements

GPU Parallel Program Development Using CUDA Tolga Soyata, 2018-01-19 GPU Parallel Program Development using CUDA teaches GPU programming by showing the differences among different families of GPUs This approach prepares the reader for the next generation and future generations of GPUs The book emphasizes concepts that will remain relevant for a long time rather than concepts that are platform specific At the same time the book also provides platform dependent explanations that are as valuable as generalized GPU concepts The book consists of three separate parts it starts by explaining parallelism using CPU multi threading in Part I A few simple programs are used to demonstrate the concept of dividing a large task into multiple parallel sub tasks and mapping them to CPU threads Multiple ways of parallelizing the same task are analyzed and their pros cons are studied in terms of both core and memory operation Part II of the book introduces GPU massive parallelism The same programs are parallelized on multiple Nvidia GPU platforms and the same performance analysis is repeated Because the core and memory structures of CPUs and GPUs are different the results differ in interesting ways The end goal is to make programmers aware of all the

good ideas as well as the bad ideas so readers can apply the good ideas and avoid the bad ideas in their own programs Part III of the book provides pointer for readers who want to expand their horizons It provides a brief introduction to popular CUDA libraries such as cuBLAS cuFFT NPP and Thrust the OpenCL programming language an overview of GPU programming using other programming languages and API libraries such as Python OpenCV OpenGL and Apple s Swift and Metal and the deep learning library cuDNN
