Microbial Processes and Products José-Luis Barredo, 2008-02-05 The development of biotechnology over the last 20 years and particularly the use of recombinant DNA techniques has rapidly expanded the opportunities for human benefits from

living resources Efforts to reduce pollution prevent environmental damage combat microbial infection improve food production and so on can each involve fermentation or the environmental lease of microorganisms Many products of fermentation technology such as alcoholic beverages bread antibiotics amino acids vitamins enzymes and others have been influenced by the progress of recombinant DNA techniques The development of new products or the more efficient manufacturing of those already being produced often involve the use of microorganisms as cell factories for many productions and biotransformations Microbial Processes and Products is intended to provide practical experimental laboratory procedures for a wide range of processes and products mediated by microorganisms Although not an exhaustive treatise it provides a detailed step by step description of the most recent developments in such applied biotechnological processes The detailed protocols we provide are cross referenced in the Notes section contain critical details lists of problems and their troubleshooting as well as safety recommendations that may not normally appear in journal articles and can be particularly useful for those unfamiliar with specific techniques

Fermentation Technology Ray Medina, 2019-05-21 Fermentation is the anaerobic conversion of sugar to carbon dioxide and alcohol by yeast or any group of chemical reactions induced by living or nonliving ferments that split complex organic compounds into relatively simple substances In fermentation a chemical change is brought on by the action of microscopic yeast molds and bacteria Fermentation is the process involving the biochemical activity of organisms during their growth development reproduction even senescence and death Fermentation technology is the use of organisms to produce food pharmaceuticals and alcoholic beverages on a large scale industrial basis The basic principle involved in the industrial fermentation technology is that organisms are grown under suitable conditions by providing raw materials meeting all the necessary requirements such as carbon nitrogen salts trace elements and vitamins The end products formed as a result of their metabolism during their life span are released into the media which are extracted for use by human being and that have a high commercial value The field of Fermentation Technology has been the scene of many stormy developments in the past decade The major products of fermentation technology produced economically on a large scale industrial basis are wine beer cider vinegar ethanol cheese hormones antibiotics complete proteins enzymes and other useful products The aim of the book is to provide an in depth study of the principles of fermentation technology and recent advances and developments in the field of fermentation technology focusing on industrial applications
