

Top Ring

This is referred to as the 'upper compression ring' . (The designation 'upper' is standard nomenclature; this is the ring that is closest to the piston's top, or crown.) The upper compression ring is the piston ring that operates under the harshest conditions with respect to thermal and mechanical loading. Its job is to form a gas-tight barrier between the piston and cylinder wall in order to 'seal' the combustion chamber.

Second Ring

This is referred to as the 'lower compression ring' . One of its jobs is to work together with the top ring in order to 'seal' the combustion chamber.

Oil Ring

As its name 'oil control ring' implies, this ring scrapes excess lubricating oil off the cylinder wall, maintaining proper lubrication while keeping oil consumption within proper limits.
