Abstract – A summary is presented of the main qualitative features of aqueous two-phase systems. Some aspects of the application of such systems to biomolecular separation are discussed. A brief description of a recent theoretical approach to aqueous two-phase systems based on statistical geometrical concepts is considered and some links are made to measurable thermodynamic properties.

Some polymer-polymer pairs or polymer-inorganic salt pairs, when in a "good" solvent, can form two immiscible homogeneous liquid phases.^{1,2} If the solvent is water, we call the systems formed "aqueous two-phase systems." Fig. 1 illustrates these two types of aqueous two-phase systems with typical compositions.

Examples of other pairs of polymers which form aqueous two-phase systems include: Dextran + Ficoll, and polyethylene glycol + Ficoll, polyvinylalcohol.* Other examples of polymer + salt aqueous two-phase systems are (see also ref. 2 and 3): methoxypolyethylene glycol + potassium phosphate, polyvinylpyrrolidone + potassium phosphate, polyethylene glycol + sodium sulphate, polyethylene glycol + sodium carbonate and polyethylene glycol + sodium chloride.

Special types of aqueous two-phase systems are those containing polyoxyethylene detergents.⁴ The formation of these systems arises from the inverse temperature/solubility behaviour of non-ionic detergents carrying polyoxyethylene groups as the hydrophilic moiety. On raising the temperature above room temperature phase separation occurs. In the two resulting phases, one is a detergent rich coacervated phase and the other is the water rich depleted phase. Terstappen *et al.*⁵ have systematically and quantitatively studied protein partitioning in

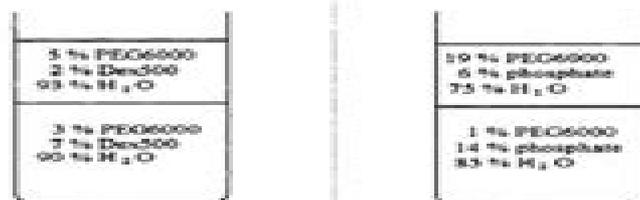

Figure 1 An illustration of the typical phase compositions of PEG 6000+Dex500 and PEG 6000+phosphate aqueous two-phase systems. The concentrations shown are based on weight.

* Usually polyethylene glycol (PEG) is a linear polymer and has the structural unit $-(CH_2CH_2O)-$. Methoxypolyethylene glycol has one end of the PEG molecule methoxylated. Dextran is composed predominantly by poly(α -1,6-glucose), Ficoll is a nonionic synthetic polymer of sucrose, polyvinyl alcohol has the structural unit $-(CH_2CHOH)-$.

aqueous solutions and presents tools for analyzing and solving scientific and practical problems arising in this area. It also presents methods that can be used to deal with ionic and nonionic aqueous solutions under sub or supercritical conditions. Illustrations and tables give examples of procedures employed to predict thermodynamic quantities of the solutions and an appendix summarizing statistical mechanical equations used to describe the systems is also provided. High Temperature Aqueous Solutions Thermodynamic Properties contains essential information for physical chemists, geochemists, geophysicists, chemical technicians and scientists involved in electric power generation. Thermodynamics of Aqueous Systems with Industrial Applications, 1980. Solution Thermodynamics and Its Application to Aqueous Solutions Yoshikata Koga, 2017-03-28. Solution Thermodynamics and its Application to Aqueous Solutions A Differential Approach Second Edition introduces a differential approach to solution thermodynamics applying it to the study of aqueous solutions. This valuable approach reveals the molecular processes in solutions in greater depth than that gained by spectroscopic and other methods. The book clarifies what a hydrophobe or a hydrophile and in turn an amphiphile does to H₂O. By applying the same methodology to ions that have been ranked by the Hofmeister series the author shows that the kosmotropes are either hydrophobes or hydration centers and that chaotropes are hydrophiles. This unique approach and important updates make the new edition a must have reference for those active in solution chemistry. **Thermodynamics of Aqueous Systems with Industrial Applications**, 1980. **Classical and Molecular Thermodynamics of Fluid Systems** Juan H. Vera, Grazyna Wilczek-Vera, Claudio Olivera-Fuentes, Costas Panayiotou, 2024-11-14. This text explores the connections between different thermodynamic subjects related to fluid systems. In an innovative way it covers the subject from first principles to the state of the art in fundamental and applied topics. Using simple nomenclature and algebra it clarifies concepts by returning to the conceptual foundation of thermodynamics. The structural elements of classical and molecular thermodynamics of fluid systems presented cover via examples and references both the usefulness and the limitations of thermodynamics for the treatment of practical problems. This new edition explores recent advances in statistical associated fluid theories and contains creative end of chapter problems connecting the theory with real life situations. It includes new chapters on thermodynamics of polymer solutions and molecular thermodynamics and also presents advances in the study of the activity of individual ions. Provides a concise structure of concepts using simple nomenclature and algebra. Clarifies problems usually overlooked by standard texts. Features end of chapter problems to enhance the reader's understanding of the concepts. Includes diverse topics of interest to researchers and advanced students including elements of statistical thermodynamics models of solutions, statistical associated fluid theory and the activity of individual ions. Offers four appendices giving step by step procedures and parameters for direct use of the PRSV equation of state and the ASOG-KT group method for fugacity and activity coefficient calculations. Features a complete set of solutions to problems throughout the book available for download on the book's webpage under Support Material. This textbook is written for advanced
