Python programmers often write code that works but isn't as maintainable, efficient, or reusable as it could be. *Mastering Python* is an advanced level guide that helps bridge that gap. It goes beyond the basics to show how to use Python in a more Pythonic way, employing newer features and best practices so your code is cleaner, faster, and more robust. Writing Pythonic code, adopting style idioms, and syntax that are considered best practice in modern Python development. Functional programming features, decorators, generators, coroutines, metaclasses, Performance optimization, efficient use of CPU and memory, profiling, concurrency, asyncio, multiprocessing, Testing, making sizable projects maintainable and shareable. *An Interdisciplinary Introduction to Image Processing* Steven L. Tanimoto, 2012-04-27. Basic principles of image processing and programming explained without college level mathematics. This book explores image processing from several perspectives: the creative, the theoretical, mainly mathematical, and the programmatical. It explains the basic principles of image processing, drawing on key concepts and techniques from mathematics, psychology of perception, computer science, and art, and introduces computer programming as a way to get more control over image processing operations. It does so without requiring college level mathematics or prior programming experience. The content is supported by PixelMath, a freely available software program that helps the reader understand images as both visual and mathematical objects. The first part of the book covers such topics as digital image representation, sampling, brightness and contrast, color models, geometric transformations, synthesizing images, stereograms, photomosaics, and fractals. The second part of the book introduces computer programming using an open source version of the easy to learn Python language. It covers the basics of image analysis and pattern recognition, including edge detection, convolution, thresholding, contour representation, and K nearest neighbor classification. A chapter on computational photography explores such subjects as high dynamic range imaging, autofocus, and methods for automatically inpainting to fill gaps or remove unwanted objects in a scene. Applications described include the design and implementation of an image based game. The PixelMath software provides a transparent view of digital images by allowing the user to view the RGB values of pixels by zooming in on an image. PixelMath provides three interfaces: the pixel calculator, the formula page, an advanced extension of the calculator, and the Python window.
