All rural livelihood systems in Ethiopia are highly sensitive to climate. Rainfall is the primary climatic factor that directly affects agriculture, hydrological dynamics, and is a driver of food insecurity. It varies across space and time. The study aims to analyse spatial-temporal variability of rainfall and its association with SSTs by using statistical methods over western Oromia, southwest Ethiopia. Annual and Kiremt rainfall distribution increases toward the central portion of the area from the east and west. Inter-annual and Kiremt rainfall variability varies from low to moderate (CV% 11 to 24%). The MK trend test shows an increasing change in annual and seasons. Mean onset date is more variable than cessation and late one to two weeks from previous studies. This may be a signal of climate change impact on the region. Earliest onset in Jimma zone mean date in the last decade of March and the latest onset in the first decade of May in west Wollega. Belg and Kiremt precipitation to SSTs showed a static relationship over different parts of the Oceans. Central and tropical eastern Pacific is negatively correlated to Kiremt summer rains over whole western Oromia zones. Spring Belg rainfall anomalies to SSTs in the region show a no significant spatial correlation relationship over most parts of the oceans. The study revealed the climatology of rainfall and local variability, which is necessary information for users to respond with local relevance in agriculture operation and hydrological management.

Local African communities heavily depend on rain-fed agriculture, which are vulnerable to the impacts of extreme weather and climate variability change. However, challenges remain in predicting African rainfall. For instance, climate models with cumulus convective parametrization lack the ability to explicitly simulate mesoscale convective systems that produce much of the total rainfall over West Africa. This study aims to improve our understanding of African rainfall variability using state-of-the-art rainfall observations and convective-permitting CP ensemble simulations. This work is organized into three research projects. In the first project, we evaluate the influence of Walker circulations on East African rainfall. Three Walker circulations are identified near East Africa: the East African, the Indian Ocean, and the Congo Basin Walker Circulations. Less precipitation occurs over equatorial East Africa during October-December with a strong weak Indian Ocean Walker Circulation. The rainfall anomalies are associated with anomalous mid-level divergence over equatorial East Africa that is likely induced by horizontal moist static energy advection. In the second project, we investigate how the observed shrinkage of Lake Chad since the 1970s affects the local climate using CP simulations. A smaller lake area enhances the local precipitation by limiting the spatial extent of daytime lake breezes, which would otherwise induce low-level subsidence, divergence, and suppress local afternoon rainfall. In addition, a shallow planetary boundary layer over the large lake weakens turbulent vertical mixing, reducing low to mid-level humidity and the

likelihood of convection triggering compared to the small lake In the third project we analyze the roles of thermodynamic and dynamic controls on intense storms over the West African Sahel with climate change Future Warming simulations are run with initial boundary conditions prescribed by the current climate data plus CMIP6 multi model mean anomalies The 99th 99th 24 hr precipitation increases from 42 77 mm in the current climate to 59 104 mm in the future over the analysis region 12 N 18 N 9 W 20 E Increased low tropospheric moisture gradient is more closely associated with this rainfall intensification than enhanced low to mid level vertical wind shear Both moisture and shear conditions are related to the storm area and propagating speed that affect local rainfall accumulation
