[Time Series Formalism](#) Usman Ayyaz, 2017 Time series data has become a modern day phenomena from stock market data to social media information modern day data exists as a

continuous flow of information indexed by timestamps Using this data to gather contextual inference and make future predictions is vital to gaining an analytical edge While there are specialized time series databases and libraries available that optimize for performance and scale there is an absence of a unifying framework that standardizes interaction with time series data sets We introduce a python based time series formalism which provides a SQL style querying interface alongside a rich selection of time series prediction algorithms Users can forecast data or impute missing entries using a specialized prediction query which employs learning models under the hood The decoupled architecture of our framework allows it to be easily substituted with any SQL database We show the functionality of our abstraction with a single machine implementation which will be a building block towards a scalable distributed platform for time series analysis

Scalable Stream Processing and Management for Time Series Data Bamdad Mousavi,2021 There has been an enormous growth in the generation of time series data in the past decade This trend is caused by widespread adoption of IoT technologies the data generated by monitoring of cloud computing resources and cyber physical systems Although time series data have been a topic of discussion in the domain of data management for several decades this recent growth has brought the topic to the forefront Many of the time series management systems available today lack the necessary features to successfully manage and process the sheer amount of time series being generated today In this today we stive to examine the field and study the prior work in time series management We then propose a large system capable of handling time series management end to end from generation to consumption by the end user Our system is composed of open source data processing frameworks Our system has the capability to collect time series data perform stream processing over it store it for immediate and future processing and create necessary visualizations We present the implementation of the system and perform experimentations to show its scalability to handle growing pipelines of incoming data from various sources
