

Chapter 13

The Multivariate Gaussian

In this chapter we present some basic facts regarding the multivariate Gaussian distribution. We discuss the two major parameterizations of the multivariate Gaussian: the centered parameterization and the canonical parameterization, and we show how the basic operations of marginalization and conditioning are carried out in these two parameterizations. We also discuss maximum likelihood estimation for the multivariate Gaussian.

13.1 Parameterizations

The multivariate Gaussian distribution is conventionally expressed in terms of the parameters μ and Σ , where μ is an $n \times 1$ vector and Σ is an $n \times n$ symmetric matrix. (We will assume for now that Σ is also positive definite, but later we will have occasion to relax this constraint.) We have the following form for the density function:

$$p(\mathbf{x}|\mu, \Sigma) = \frac{1}{(2\pi)^{n/2} |\Sigma|^{1/2}} \exp\left\{-\frac{1}{2}(\mathbf{x} - \mu)^T \Sigma^{-1}(\mathbf{x} - \mu)\right\}, \quad (13.1)$$

where \mathbf{x} is a vector in \mathbb{R}^n . The density can be integrated over values in \mathbb{R}^n to verify probabilistic axioms for these values.

The geometry of the multivariate Gaussian is essentially that associated with the quadratic form $f(\mathbf{x}) = \frac{1}{2}(\mathbf{x} - \mu)^T \Sigma^{-1}(\mathbf{x} - \mu)$ in the exponent of the density. Recall our discussion in Chapter 11, where we showed that a quadratic form $f(\mathbf{x})$ is a paraboloid with level surfaces, i.e., surfaces of the form $f(\mathbf{x}) = c$ for fixed c , being ellipsoids centered along the eigenvectors of the matrix Σ . Note that the eigenvectors, $\text{eig}(\Sigma)$, is a vector function that leaves the generalized means of the quadratic form intact. Thus in the case c being an eigenvalue $f(\mathbf{x}) = c$, we obtain the (open) strip $[-c, c]$. The maximum value of the exponent in Σ , obtained at $\mathbf{x} = \mu$ where $f(\mathbf{x}) = 0$. The paraboloid $f(\mathbf{x})$ increases to infinity as we move away from $\mathbf{x} = \mu$, thus we obtain a “strip” in $(n - 1)$ -dimensional space centered at $\mathbf{x} = \mu$. The level surfaces of the Gaussian being an ellipsoid centered along the eigenvectors of Σ .

Multivariate Calculation R.H. Farrell, 2012-12-06 Like some of my colleagues in my earlier years I found the multivariate Jacobian calculations horrible and unbelievable As I listened and read during the years 1956 to 1974 I continually saw alternatives to the Jacobian and variable change method of computing probability density functions Further it was made clear by the work of A T James that computation of the density functions of the sets of roots of determinantal equations required a method other than Jacobian calculations and that the densities could be calculated using differential forms on manifolds It had become clear from the work of C S Herz and A T James that the expression of the noncentral multivariate density functions required integration with respect to Haar measures on locally compact groups Material on manifolds and locally compact groups had not yet reached the pages of multivariate books of the time and also much material about multivariate computations existed only in the journal literature or in unpublished sets of lecture notes In spirit being more a mathematician than a statistician the urge to write a book giving an integrated treatment of these topics found expression in 1974 1975 when I took a one year medical leave of absence from Cornell University During this period I wrote *Techniques of Multivariate Calculation* Writing a coherent treatment of the various methods made obvious required background material
