AVR121: Enhancing ADC resolution by oversampling
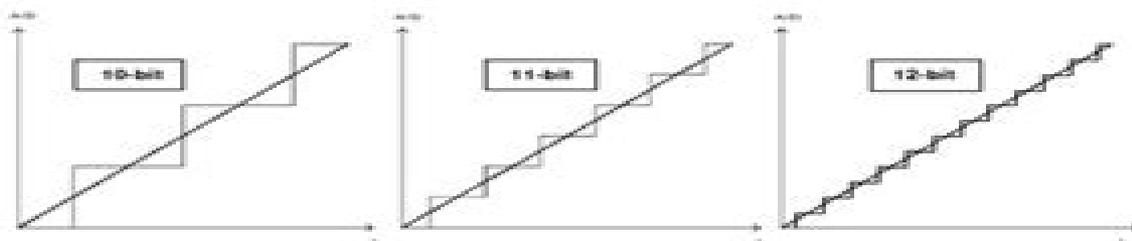

Features

- Increasing the resolution by oversampling
- Averaging and decimation
- Noise reduction by averaging samples

1 Introduction

Atmel's AVR controller offers an Analog to Digital Converter with 10-bit resolution. In most cases 10-bit resolution is sufficient, but in some cases higher accuracy is desired. Special signal processing techniques can be used to improve the resolution of the measurement. By using a method called 'Oversampling and Decimation' higher resolution might be achieved, without using an external ADC. This Application Note explains the method, and which conditions need to be fulfilled to make this method work properly.

Oversampling A/D Converters with Improved Signal Transfer Functions Bupesh Pandita,2011-09-15 This book describes techniques for designing complex discrete time ADCs with signal transfer functions that significantly filter interfering signals The book provides an understanding of theory issues and implementation of discrete complex ADCs The concepts developed in each chapter are further explained by applying them to a target application of ADCs in DTV receivers

High-performance Oversampling A/D Converter Design Techniques in Scaled CMOS Technologies Shaolan Li,2018 Oversampling analog to digital converters ADCs are specialists in digitizing real word signals in high resolution They have been crucial building blocks in many modern electronic systems and are expected to have a growing significance in the booming era of Internet of Things IoT However many classic oversample ADC techniques are power hungry and scaling unfriendly making them deficient for many emerging applications To address this challenge this thesis explores solution from two directions voltage controlled oscillator VCO based ADC and hybrid ADC The first work presents a VCO based ADC featuring a novel phase extended quantizer PEQ Compared to prior VCO based ADCs the proposed phase extension technique enabled this work to achieve 1 bit higher resolution with very little power and circuit overhead On top of resolution boosting A tri level resistor digital to analog converter DAC is also introduced as complementary to the new quantizer enabling high DR while creating a dynamic power saving mechanism for the proposed design Fabricated in 130 nm CMOS the prototype ADC achieved peak Schreier Figure of Merits FoM of 174 3 dB marking 2 5x improvement over prior arts The second project extends the achievement of the first and develops techniques to push the performance frontier of high order VCO based ADC Existing high order VCO based ADCs still rely on OTA based active loop filter which deemphasizes the merits of the VCO based quantizer To address their limitation a hybrid passive VCO architecture is proposed where we made the front end loop filter fully passive and zero power and used the VCO to support the entire loop gain This technique innovatively utilizes the parasitic effect of the VCO hence also obviates the need for parasitic

cancellation A prototype fabricated in 40 nm CMOS measured 19 fJ conversion Walden FoM achieving 5x improvement over existing high order VCO based ADC Finally this thesis also presents the design of a noise shaping SAR NS SAR ADC Unlike prior works that all rely on the cascaded integrator feed forward CIFF structure this work distinctively employs the error feedback EF structure It is the first in its kind to achieves second order NTF with complex zero optimization using all low power scaling friendly building blocks such as passive finite impulse response FIR filter and dynamic amplifier D Amp A background calibration scheme is also developed to improve robustness over process voltage temperature PVT variation The prototype chip fabricated in 40nm CMOS measured the state of the art performance of 178 dB Schreier FoM This works demonstrated a NS SAR solution that combines optimized NTF power efficiency and PVT robustness
