The basic difference is that SQL can handle large datasets in a consistent manner based on mathematical foundations. You can throw together a computer language easily: assignment statements, looping, if-then-conditional, 300 library functions, and voila! Here is the new language Mars 1, named after the red planet to be fashionable with NASA's new Mars robot. However, can Mars 1 JOIN a table of 1 million rows with a table of 10 million rows in a second? The success of SQL language is so compelling that other technologies are tagged onto it like XML, XQuery which deals with semi-structured information objects. In SQL you are thinking at a high level. In C or Java you are dealing with details, lots of them. That is the major difference. Why is so much of the book dedicated to database design? Why not plunge into SQL coding and eventually the developer will get a hang of the design? Because high level thinking requires thinking at the database design level. A farmer has six mules. How do we model it in the database? We design the Farmer and FarmAnimal tables and then connect them with FarmerID FOREIGN KEY in FarmAnimal referencing the FarmerID PRIMARY KEY in the Farmer table. What is the big deal about it? It looks so simple. In fact, how about just calling the tables Table1 and Table2 to be more generic? Ouch! Meaningful naming is the very basis of good database design. Relational database design is truly simple for simple, well-understood models. The challenge starts in modeling complex objects such as financial derivative instruments, airplane passenger scheduling, or a social network website. When you need to add 5 new tables to a 1000 table database and hook them in, define FOREIGN KEY references correctly, it is a huge challenge. To begin with, some of the five new tables may already be redundant, but you don't know that until you understand what the 1000 tables are really storing. Frequently, learning the application area is the biggest challenge for a developer when starting a new job. The SQL language is simple to program and read, even when touching 10 tables. Complexities abound though. The very first one does the SQL statement touch the right data set, 999 records and 1000 or 998.
