Tall Building Criteria and Loading Leslie E. Robertson,Takeo Naka,1980-01-01 Prepared by the Council on Tall Buildings and Urban Habitat of ASCE

This report examines the loads to which tall buildings are subjected so that engineers can precisely define the related structural elements that are necessary before translating a client's needs into a safe design. The report explores five different classes of loads: gravity loads and temperature effects, earthquake loads, wind loading and wind effects, fire and accidental loads, as well as quality control and overall safety considerations. Steel buildings, which hold the record for height, tax the designer's ingenuity to provide adequate resistance to lateral loading. Concrete buildings are both more numerous and widely distributed, and for them vertical gravity loads may be the chief problem. Both steel and concrete buildings and lateral and vertical loads are addressed. Other subjects covered include dead live cyclic snow, construction and combined loads, code requirements, meteorological and environmental factors in design, firefighting provisions, and modeling. Contributions came from more than 800 contributors, all international and professional, and heavily representing design and industrial firms. Condensed references follow each chapter, and a glossary is included.
