

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the cylinder, the combustion chamber and the valve in a cylinder or other component. These concepts show 2 gaskets which distribute load (force) in a gasket with an application on all three are made simultaneously used to increase the gasket. A gasket is used to maintain the pressure in a cylinder and to prevent it from leaking throughout the life cycle application. The gasket compresses the two components between the mating surfaces of the vessel. This is done by creating a radial force on the cylinder the gasket is used to seal the combustion chamber between the mating surfaces. If the gasket sealing mechanism is not properly and consistently through the life of the application then it would be considered a failure.

In order to determine the application requirements will require the gasket designer to determine the gasket to select a certain seal. Every gasket application or design has many considerations therefore that must be addressed by specifying the performance of what the gasket is required to do in the application.
