## "TAKE FIVE" BREATHING

## STRETCHING EXERCISES

Stretch your arms, legs, and neck, holding each stretch for 15-30 seconds while focusing on your breath and noticing how your body feels.

## REACH OUT TO A TRUSTED FRIEND

Contact a friend who can provide emotional support, encouragement, a listening ear to vent to, and a sense of connection.

## A-Z CATEGORY GAME

Think of a category (e.g., countries or animals) then go through the alphabet and think of something in that category that begins with each letter as a distraction from anxiety.

Behavioral and Physiological Bases of Attentional Biases: Paradigms, Participants, and Stimuli Daniela M. Pfabigan,Ulrich S. Tran,2015-08-21 Attentional biases ABs play a prominent role in the development and maintenance of clinically relevant symptoms of for example anxiety and depression In particular increased attentional orienting and preoccupation with biologically relevant and mood congruent stimuli has been observed suggesting that the visual attentional system is overly sensitive towards threat cues and avoidant of cues of reward in these disorders First several experimental paradigms have been used to assess ABs e g the dot probe task the emotional stroop task and the spatial cueing task amongst others Yet these paradigms are based on different theoretical backgrounds and target different stages of the attentional process Thus different paradigms provided converging as well as diverging evidence with regard to ABs However it is often not entirely clear to what extent this reflects real differences and commonalities or is caused by differences in methodology For example behavioral reaction time data can only provide a snapshot of selective attention Measuring event related potentials eye movements or functional brain imaging data enables exploring the exact temporal and spatial dynamics of attentional processes Moreover neuroimaging data reveal specific cortical networks involved in directing attention toward a stimulus or disengaging from it Second ABs have been mainly discussed as symptoms of psychopathology while results in healthy participants are still scarce previous studies mostly compared extreme groups However a comprehensive theoretical and empirical account of ABs in psychopathology also requires a thorough account of ABs in the general healthy population Moreover the effect of gender as an important contributing factor in processing of emotional stimuli has also not been considered systematically in previous research Third a variety of stimuli has been used in the assessment of ABs So far mostly facial or word stimuli have been applied However in everyday life not only facial emotion recognition but also a fast evaluation of complex social situations is important to be effective in social interactions Recent research started using more complex stimuli to raise ecological validity However the use of ecologically valid stimuli poses some methodological challenges and needs to be applied more systematically The aim of this research topic is to integrate different paradigms and stimuli addressing individuals from the whole range of the population continuum and to apply different methodological approaches It is intended to bring together expertise in stimulus selection timing and implementing issues advancing and broadening the overall understanding of ABs
