Shiva,2007-11-30 Suitable for a one or two semester undergraduate or beginning graduate course in computer science and computer engineering Computer Organization Design and Architecture Fourth Edition presents the operating principles capabilities and limitations of digital computers to enable development of complex yet efficient systems With 40% updated material and four new chapters this edition takes students through a solid up to date exploration of single and multiple processor systems embedded architectures and performance evaluation New to the Fourth Edition Additional material that covers the ACM IEEE computer science and engineering curricula More coverage on computer organization embedded systems networks and performance evaluation Expanded discussions of RISC CISC VLIW and parallel pipelined architectures The latest information on integrated circuit technologies and devices memory hierarchy and storage Updated examples references and problems Supplying appendices with relevant details of integrated circuits reprinted from vendors manuals this book provides all of the necessary information to program and design a computer system **System-Level Design of GPU-Based Embedded Systems** Arian Maghazeh,2018-12-07 Modern embedded systems deploy several hardware accelerators in a heterogeneous manner to deliver high performance computing Among such devices graphics processing units GPUs have earned a prominent position by virtue of their immense computing power However a system design that relies on sheer throughput of GPUs is often incapable of satisfying the strict power and time related constraints faced by the embedded systems This thesis presents several system level software techniques to optimize the design of GPU based embedded systems under various graphics and non graphics applications As compared to the conventional application level optimizations the system wide view

of our proposed techniques brings about several advantages First it allows for fully incorporating the limitations and requirements of the various system parts in the design process Second it can unveil optimization opportunities through exposing the information flow between the processing components Third the techniques are generally applicable to a wide range of applications with similar characteristics In addition multiple system level techniques can be combined together or with application level techniques to further improve the performance We begin by studying some of the unique attributes of GPU based embedded systems and discussing several factors that distinguish the design of these systems from that of the conventional high end GPU based systems We then proceed to develop two techniques that address an important challenge in the design of GPU based embedded systems from different perspectives The challenge arises from the fact that GPUs require a large amount of workload to be present at runtime in order to deliver a high throughput However for some embedded applications collecting large batches of input data requires an unacceptable waiting time prompting a trade off between throughput and latency We also develop an optimization technique for GPU based applications to address the memory bottleneck issue by utilizing the GPU L2 cache to shorten data access time Moreover in the area of graphics applications and in particular with a focus on mobile games we propose a power management scheme to reduce the GPU power consumption by dynamically adjusting the display resolution while considering the user s visual perception at various resolutions We also discuss the collective impact of the proposed techniques in tackling the design challenges of emerging complex systems The proposed techniques are assessed by real life experimentations on GPU based hardware platforms which demonstrate the superior performance of our approaches as compared to the state of the art techniques *Computer Organization, Design, and Architecture* Sajjan G.
