Beijnum,2002-09-11 Border Gateway Protocol BGP is the routing protocol used to exchange routing information across the Internet It makes it possible for ISPs to connect to each other and for end users to connect to more than one ISP BGP is the only protocol that is designed to deal with a network of the Internet s size and the only protocol that can deal well with having multiple connections to unrelated routing domains This book is a guide to all aspects of BGP the protocol its configuration and operation in an Internet environment and how to troubleshooting it The book also describes how to secure BGP and how BGP can be used as a tool in combating Distributed Denial of Service DDoS attacks Although the examples throughout this book are for Cisco routers the techniques discussed can be applied to any BGP capable router The topics include Requesting an AS number and IP addresses Route filtering by remote ISPs and how to avoid this Configuring the initial BGP setup Balancing the available incoming or outgoing traffic over the available connections Securing and troubleshooting BGP BGP in larger networks interaction with internal routing protocols scalability issues BGP in Internet Service Provider networks The book is filled with numerous configuration examples with more complex case studies at the end of the book to strengthen your understanding BGP is for anyone interested in creating reliable connectivity to the Internet   **BGP Secure Routing Extension (BGP-SRx)** Oliver Borchert,2021 In this paper we first describe the problem space Following that we describe the design and implementation of the NIST reference implementation for RPKI based route origin validation BGP OV and BGPsec path validation BGP PV within a BGP router The system we developed is called BGP Secure Routing Extension BGP SRx We describe the system design explain the design choices communications between all components and present the performance measurements obtained during the implementation stages This paper is organized so that it first explains the high level system design with a brief explanation of all components and how they interact We will explain why we chose this design and provide a discussion of its benefits as well as shortcomings Furthermore we show which open source components we chose and how we extended them for this project The BGP SRx implementation is a reference implementation for RPKI OV with all its router side components as specified in RFC 6811 RFC 6810 and RFC 8210 as well as for BGPsec path validation as specified in RFC 8205 and RFC 8608 The implementation allowed early identification of issues while the specifications were still under development hence provided important feedback to the development of the different IETF RFCs   **Big Book of Border Gateway Protocol (BGP) RFCs** ,2000 This work looks at Border Gateway Protocol and shows how it defines how backbone routing i e routing on a line carrying data gathered from smaller lines is carried out on the Internet or large intranets extranets BGP differs from its alternatives in that it is an industrial strength routing protocol suitable for use in high bandwidth backbone environments Soon all non local internet traffic will be routed via BGP and as intranets extranets become more complet BGP should become even more in the corporate environment   **BGP4** John W.
